*Sleep and Chronobiology in Plasticity and Memory* Jason Robert Gerstner, H. Craig Heller, Sara J. Aton, 2016-01-15 Chronobiological mechanisms regulating time of day mediated behaviors such as sleep and circadian rhythms are thought to interact with and or share cellular and molecular signaling cascades that shape synaptic plasticity and neural excitability These same factors are also known to underlie events that govern higher order cognitive processing including learning and memory formation and often through phylogenetically conserved pathways This suggests that factors which contribute to adaptive responses to changing environmental stimuli are likely derived from basic evolutionarily ancient processes and underscores the importance of using both invertebrate and vertebrate models to study the interaction of chronobiology and cognitive processing This issue highlights current views along with original research on sleep and circadian features of plasticity and memory in multiple species models and systems
