Nonlinear Laser Dynamics From Quantum Dots To Cryptography:

Nonlinear Laser Dynamics Kathy Lüdge, 2012-04-09 A distinctive discussion of the nonlinear dynamical phenomena of semiconductor lasers. The book combines recent results of quantum dot laser modeling with mathematical details and an analytic understanding of nonlinear phenomena in semiconductor lasers and points out possible applications of lasers in cryptography and chaos control. This interdisciplinary approach makes it a unique and powerful source of knowledge for anyone intending to contribute to this field of research. By presenting both experimental and theoretical results the distinguished authors consider solitary lasers with nano structured material as well as integrated devices with complex feedback sections. In so doing they address such topics as the bifurcation theory of systems with time delay analysis of chaotic dynamics and the modeling of quantum transport. They also address chaos based cryptography as an example of the technical application of highly nonlinear laser systems.

Dynamics of Quantum Dot Lasers Christian Otto, 2014-01-21 This thesis deals with the dynamics of state of the art nanophotonic semiconductor structures providing essential information on fundamental aspects of nonlinear dynamical systems on the one hand and technological applications in modern telecommunication on the other. Three different complex laser structures are considered in detail i a quantum dot based semiconductor laser under optical injection from a master laser ii a quantum dot laser with optical feedback from an external resonator and iii a passively mode locked quantum well semiconductor laser with saturable absorber under optical feedback from an external resonator. Using a broad spectrum of methods both numerical and analytical this work achieves new fundamental insights into the interplay of microscopically based nonlinear laser dynamics and optical perturbations by delayed feedback and injection.

Passively Mode-Locked Semiconductor Lasers Lina Jaurigue, 2017-06-22 This thesis investigates the dynamics of passively mode locked semiconductor lasers with a focus on the influence of optical feedback on the noise characteristics. The results presented here are important for improving the performance of passively mode locked semiconductor lasers and at the same time are relevant for understanding delay systems in general. The semi analytic results developed are applicable to a broad range of oscillatory systems with time delayed feedback making the thesis of relevance to various scientific communities. Passively mode locked lasers can produce pulse trains and have applications in the contexts of optical clocking microscopy and optical data communication among others. Using a system of delay differential equations to model these devices a combination of numerical and semi analytic methods is developed and used to characterize this system.

Nonequilibrium Statistical Physics of Small Systems Rainer Klages, Wolfram Just, Christopher Jarzynski, 2013-03-15 This book offers a comprehensive picture of nonequilibrium phenomena in nanoscale systems. Written by internationally recognized experts in the field this book strikes a balance between theory and experiment and includes in depth introductions to nonequilibrium fluctuation relations, nonlinear dynamics and transport, single molecule experiments and molecular diffusion in nanopores. The authors explore the application of these concepts to nano and biosystems by cross

linking key methods and ideas from nonequilibrium statistical physics thermodynamics stochastic theory and dynamical systems By providing an up to date survey of small systems physics the text serves as both a valuable reference for experienced researchers and as an ideal starting point for graduate level students entering this newly emerging research field

Spatio-Temporal Modeling and Device Optimization of Passively Mode-Locked Semiconductor Lasers

Stefan Meinecke,2022-03-26 This thesis investigates passively mode locked semiconductor lasers by numerical methods The understanding and optimization of such devices is crucial to the advancement of technologies such as optical data communication and dual comb spectroscopy The focus of the thesis is therefore on the development of efficient numerical models which are able both to perform larger parameter studies and to provide quantitative predictions Along with that visualization and evaluation techniques for the rich spatio temporal laser dynamics are developed these facilitate the physical interpretation of the observed features The investigations in this thesis revolve around two specific semiconductor devices namely a monolithically integrated three section tapered quantum dot laser and a V shaped external cavity laser In both cases the simulations closely tie in with experimental results which have been obtained in collaboration with the TU Darmstadt and the ETH Zurich Based on the successful numerical reproduction of the experimental findings the emission dynamics of both lasers can be understood in terms of the cavity geometry and the active medium dynamics The latter in particular highlights the value of the developed simulation tools since the fast charge carrier dynamics are generally not experimentally accessible during mode locking operation Lastly the numerical models are used to perform laser design explorations and thus to derive recommendations for further optimizations
