focuses on potential limitations and recommendations for the digital mental health landscape. Authors synthesize existing literature on the validity of digital health technologies including smartphones, apps, sensors, chatbots, and telepsychiatry for mental health disorders. They also note that collecting real-time biological information is usually better than just collecting filled-in forms and that this will also mitigate problems related to recall bias in clinical appointments. Limitations such as confidentiality, engagement, and retention rates are moreover discussed. Presented in fifteen chapters, the work addresses the following questions: may smartphones and sensors provide more accurate information about patients' symptoms between clinical appointments which in turn avoid recall bias? Is there evidence that digital phenotyping could help in clinical decisions in mental health? Is there scientific evidence to support the use of mobile interventions in mental health? Digital Mental Health will help clinicians and researchers, especially psychiatrists and psychologists, to define measures and to determine how to test apps or usefulness, feasibility, and efficacy in order to develop a consensus about reliability. These professionals will be armed with the latest evidence as well as prepared to a new age of mental health.
