

Critique of Qualitative and Quantitative Research Articles on Diabetes

Summary

This paper provides a critique of two articles: A qualitative study and a quantitative study. The critique is done in form of a template that generally entails analyzing the research methods that each of the study uses to achieve its objective. The quantitative article involved determining if age at migration influences diabetes among Hispanic immigrants in United States. In the qualitative study, the researchers set out to explore self-management practices among diabetic patients and better control of glycemic control. The critique of these two articles has revealed that the two research approaches differ greatly in terms of the techniques they use. In general, the areas examined include research problem and purpose, literature review, theoretical/conceptual framework, methods of data collection and analysis, research design, study population, ethical consideration, discussion of findings, limitations, implications and recommendations and importance of the study in my practice.

The second part of this paper provides a comparison of the information gained from analyzing the two different research methods in the articles. It also provided the pros and cons of the two research approaches and provided examples from the articles. Moreover, it provided a response to the statement that qualitative research is not scientific. Finally, it highlighted the general insights that researchers can gain from qualitative and quantitative studies. Qualitative studies are explorative in nature and use non-numerical data to gain a better understanding of the phenomena. Quantitative studies are descriptive in nature and uses quantifiable data to formulate information and discover pattern in research. The quantitative research tends to be more scientific than the qualitative research.
