House & Garden, 1973 **Farmers and Consumers Market Bulletin**, 2011 *Evaluation of the Nest Learning Thermostat in a Multifamily Apartment Setting* Christopher J McHugh, 2017 Since 2011 the Nest Learning thermostat utilizing proprietary occupancy scheduling algorithms and sensors has transformed the residential and small commercial programmable thermostat market into a smart thermostat market. Due to usability and design challenges a majority of people who have programmable thermostats do not properly operate them often times leading to lower potential energy savings and even higher energy consumption than conventional non programmable thermostats. Compared to

previous thermostats however the Nest thermostat is designed to learn its occupants schedules and develop a heating and cooling schedule to best meet its occupants thermal comfort needs bridging the usability and functionality gap that exists with previous programmable thermostats While most thermostat research is focused on single family homes this study was conducted using a multifamily apartment complex where occupants were not responsible for their bills This study emphasizes the importance of using smart thermostats correctly to realize expected energy savings and how even a smart thermostat can fail to save energy if its features are not used

A Study of the Potential Impact of Smart Thermostats on Residential Energy Efficiency and Demand Response in North America

Diego Ariza Muñoz,2016 This thesis evaluates the potential impact of smart thermostats on the residential energy efficiency and demand response in North America Smart thermostats are rapidly gaining popularity and our estimations indicate that today there are more than nine million units already installed in North America Electric utilities have recently started pilot programs known as Bring Your Own Thermostat BYOT through which they subsidize part of the smart thermostat that their customers install in their homes in exchange for taking command of the settings certain hours per day during for a few summer days Currently there are only about 50 000 homeowners enrolled in BYOT programs in the USA but the expectation that smart thermostats can impact energy efficiency and change the residential demand response DR landscape is high Using System Dynamics this thesis has examined this potential and the results show that the smart thermostats in the business as usual case can save about 60 TWh year of electricity or the continuous production of about fifteen 500MW coal plants or Rosenfelds by 2025 If programs such as BYOT where part of the thermostat is subsidized were going to be popularized this number can almost double And additionally this technology is creating an important potential in the residential demand response space which is also studied in this thesis

dataset consists of 7500 homes in major cities in North America. Over 100 models were trained using a variety of clustering algorithms and combinations of features. The highest performing models had classification accuracies ranging between 7-9% higher than random. The study did not observe a relationship between thermostat adjustments and general building properties. Instead, the study found positive correlations between the number of thermostat adjustments and the age of the home. The contribution of this work is to showcase a detailed approach for conducting such analysis.

Smart Thermostat

Evaluation Protocol: December 2016 - May 2023 A smart thermostat is an internet connected device that controls home heating, ventilation, and air conditioning (HVAC) equipment and can automatically adjust temperature set points to optimize performance and achieve energy savings. Smart thermostat features often include two way communication, occupancy detection such as geofencing and occupancy sensors, schedule learning, and seasonal optimization algorithms. Smart thermostats can control most conventional HVAC systems including central air conditioners, heat pumps, and forced air furnaces. Several types of residential utility programs offer smart thermostats as replacements measures. Working with smart thermostat vendors, utilities can offer separate optimization programs to produce energy savings beyond those achieved by installing a smart thermostat. From an evaluation perspective, smart thermostat programs have several noteworthy features. First, the energy savings from a smart thermostat may change over the life of the device. As a smart thermostat is connected to the internet, original equipment manufacturers can update the thermostat software to improve the thermostat's energy efficiency. Likewise, users can adjust the thermostat settings and schedules over time in response to changes in weather, thermal comfort, energy prices, or preferences for energy efficiency. Additionally, many thermostat manufacturers offer seasonal optimization programs that recommend changes or make minor automated adjustments to the thermostat settings to improve energy efficiency. These opt in programs are now standard offerings for many smart thermostat manufacturers and provided at no additional cost to users. The potential for software updates and continuous optimization and the evolving nature of user interactions mean future energy savings may differ from first year savings and the energy savings of smart thermostats may need to be evaluated more than once. Second, smart thermostats often have small unit energy savings relative to a home's total energy consumption, especially in comparison to whole home retrofit programs. This can make it difficult to detect the smart thermostat savings in billing or advanced metering infrastructure (AMI) meter consumption data. For example, as cooling loads in many regions average about 20% of annual electricity consumption, smart thermostat savings of 10% of cooling energy use would equate to a 2% reduction in home electricity consumption. Evaluators should use regression analysis of whole home billing consumption or advanced metering infrastructure (AMI) meter consumption data to evaluate smart thermostat savings because, as explained at greater length below, these data are usually available to evaluators and regression can control for the impacts of weather and other potentially confounding factors on a home's energy consumption. Finally, as with other energy efficiency programs, participation in smart thermostat programs is self-

selective As discussed at greater length below smart thermostat participants tend to be among other things younger higher income and more likely to adopt electric vehicles EVs and internet connected devices than nonparticipants These differences are often unobservable to the evaluator and correlated with a home's energy consumption creating the potential for bias in estimating savings Due to the small unit savings of thermostats errors and biases from self selection that may not be very consequential when evaluating a whole home retrofits e g 2% of home electricity consumption can have a major impact when evaluating the savings and cost effectiveness of smart thermostat programs A percentage point change in the estimated savings could affect the cost effectiveness of a program This means it is important for evaluators to assess and to minimize the potential for error from selection bias in estimating smart thermostat program savings The Uniform Methods Project provides model protocols for determining energy savings and demand reductions that result from specific energy efficiency measures implemented through state and utility programs In most cases the measure protocols are based on a particular option identified by the International Performance Verification and Measurement Protocol however this work provides a more detailed approach to implementing that option Each chapter is written by technical experts in collaboration with their peers reviewed by industry experts and subject to public review and comment The UMP protocols can be used by utilities program administrators public utility commissions evaluators and other stakeholders for both program planning and evaluation
