Deterministic Lotsizing Models for Production Planning Marc Salomon, 2013-11-11 This thesis deals with timing and sizing decisions for production lots and more precisely with mathematical models to support optimal timing and sizing decisions. These models are called lotsizing models. They are characterized by the fact that production lots are determined based on a trade off between production costs and customer service. Production costs can be categorized as basic production costs which consist of material costs, labour costs, machine startup costs and overhead costs and inventory related costs which include costs of capital tied up in inventory, insurances and taxes. Customer service is the capability of the firm to deliver to their clients the products in the quantity they ordered at the agreed upon time and place. The costs of realizing a certain service level are usually very difficult to convert into money. They include costs of expediting, loss of customer goodwill and loss of sales revenues resulting from the shortage situation.

Production Planning by Mixed Integer Programming Yves Pochet, Laurence A. Wolsey, 2006-09-23 This textbook provides a comprehensive modeling reformulation and optimization approach for solving production planning and supply chain planning problems covering topics from a basic introduction to planning systems, mixed integer programming (MIP) models and algorithms through the advanced description of mathematical results in polyhedral combinatorics required to solve these problems. Based on twenty years worth of research in which the authors have played a significant role, the book addresses real life industrial production planning problems involving complex production structures with multiple production stages using MIP modeling and reformulation approach. The book provides an introduction to MIP modeling and to planning systems, a unique collection of reformulation results and an easy to use problem solving library. This approach is demonstrated through a series of real life case studies, exercises and detailed illustrations.

Review by Jakub Marecek, Computer Journal. The emphasis put on mixed integer rounding and mixing sets heuristics built in general purpose integer programming solvers as well as on decompositions and heuristics using integer programming should be praised. There is no doubt that this volume offers the present best introduction to integer programming formulations of lotsizing problems encountered in production planning. 2007

Planning Production and Inventories in the Extended Enterprise Karl G. Kempf, Pinar Keskinocak, Reha Uzsoy, 2011-01-12 In two volumes, *Planning Production and Inventories in the Extended Enterprise: A State of the Art Handbook* examines production planning across the extended enterprise against a backdrop of important gaps between theory and practice. The early chapters describe the multifaceted nature of production planning problems and reveal many of the core complexities. The middle chapters describe recent research on theoretical techniques to manage these complexities. Accounts of production planning systems currently in use in various industries are included in the later chapters. Throughout the two volumes, there are suggestions on promising directions for future work focused on closing the gaps.

Computational Combinatorial Optimization Michael Jünger, Denis Naddef, 2001-11-21 This tutorial contains written versions of seven lectures
