Mastering Embedded Linux Programming

Chris Simmonds, 2017-06-30

Learn to confidently develop, debug and deploy robust embedded Linux systems with hands on examples using BeagleBone and QEMU. Key Features: Step by step guide from toolchain setup to real time programming with hands on implementation. Practical insights on kernel configuration, device drivers and memory management. Covers hardware integration using BeagleBone Black and virtual environments via QEMU. Book Description: Embedded Linux runs many of the devices we use every day from smart TVs to WiFi routers, test equipment to industrial controllers. All of them have Linux at their heart. Linux is a core technology in the implementation of the interconnected world of the Internet of Things. You will begin by learning about the fundamental elements that underpin all embedded Linux projects: the toolchain, the bootloader, the kernel and the root filesystem. You'll see how to create each of these elements from scratch and how to automate the process using Buildroot and the Yocto Project. Moving on, you'll find out how to implement an effective storage strategy for flash memory chips and how to install updates to the device remotely once it is deployed. You'll also get to know the key aspects of writing code for embedded Linux such as how to access hardware from applications, the implications of writing multi threaded code and techniques to manage memory in an efficient way. The final chapters show you how to debug your code both in applications and in the Linux kernel and how to profile the system so that you can look out for performance bottlenecks. By the end of the book you will have a complete overview of the steps required to create a successful embedded Linux system. What you will learn: Evaluate the Board Support Packages offered by most manufacturers of a system on chip or embedded module. Use Buildroot and the Yocto Project to create embedded Linux systems quickly and efficiently. Update IoT devices in the field without compromising security. Reduce the power budget of devices to make batteries last longer. Interact with the hardware without having to write kernel device drivers. Debug devices remotely using GDB and see how to measure the performance of the systems using powerful tools such as perf, ftrace and valgrind. Who this book is for: This book is for embedded engineers, Linux developers and computer science students looking to build real world embedded systems. It suits readers who are

familiar with basic Linux use and want to deepen their skills in kernel configuration debugging and device integration
