**Nonnegative and Compartmental Dynamical Systems** Wassim M. Haddad,VijaySekhar Chellaboina,Qing Hui,2010-01-04 This comprehensive book provides the first unified framework for stability and dissipativity analysis and control design for nonnegative and compartmental dynamical systems which play a key role in a wide range of fields including engineering thermal sciences biology ecology economics genetics chemistry medicine and sociology Using the highest standards of exposition and rigor the authors explain these systems and advance the state of the art in their analysis and active control design Nonnegative and Compartmental Dynamical Systems presents the most complete treatment available of system solution properties Lyapunov stability analysis dissipativity theory and optimal and adaptive control for these systems addressing continuous time discrete time and hybrid nonnegative system theory This book is an indispensable resource for applied mathematicians dynamical systems theorists control theorists and engineers as well as for researchers and graduate students who want to understand the behavior of nonnegative and compartmental dynamical systems that arise in areas such as biomedicine demographics epidemiology pharmacology telecommunications transportation thermodynamics networks heat transfer and power systems     Biology and Control Theory: Current Challenges Isabelle Queinnec,Sophie Tarbouriech,Germain Garcia,Silviu-Iulian Niculescu,2007-08-07 Creating some links between control feedback and biology modeling communities based on similarities in modeling observing and perceiving alive structures and analyzing interconnections between biological structures and subsystems was the main objective of this volume In this context biology systems need appropriate analysis tools due to their structure and hierarchy complexity and environment interference and we believe that these aspects may generate interesting research topics in control area Indeed several works raising the potential impact of control developments to bring some beginning of answers in the context of biological systems have been published in the recent years The idea of this book was conceived in the context mentioned above with the objective to help in claiming many of the problems for control researchers starting discussions and opening interactive debates between the control and biology communities and finally to alert graduate students to the many interesting ideas at the frontier between control feedback theory and biology     Stability and Dissipativity Theory for Nonnegative and Compartmental Dynamical Systems Elias August,2001     Impulsive and Hybrid Dynamical Systems Wassim M. Haddad,VijaySekhar Chellaboina,Sergey G. Nersesov,2014-09-08 This book develops a general analysis and synthesis framework for impulsive and hybrid dynamical systems Such a framework is imperative for modern complex engineering systems that involve interacting continuous time and discrete time dynamics with multiple modes of operation that place stringent demands on controller design and require implementation of increasing complexity whether advanced high performance tactical fighter aircraft and space vehicles variable cycle gas turbine engines or air and ground transportation systems Impulsive and Hybrid Dynamical Systems goes beyond similar treatments by developing invariant set stability theorems partial stability Lagrange stability boundedness

ultimate boundedness dissipativity theory vector dissipativity theory energy based hybrid control optimal control disturbance rejection control and robust control for nonlinear impulsive and hybrid dynamical systems A major contribution to mathematical system theory and control system theory this book is written from a system theoretic point of view with the highest standards of exposition and rigor It is intended for graduate students researchers and practitioners of engineering and applied mathematics as well as computer scientists physicists and other scientists who seek a fundamental understanding of the rich dynamical behavior of impulsive and hybrid dynamical systems **Advances in Time-Delay**

**Systems** Silviu-Iulian Niculescu, Kebin Gu, 2012-12-06 In the mathematical description of a physical or biological process it is a common practice to assume that the future behavior of the process considered depends only on the present state and therefore can be described by a finite set of ordinary differential equations This is satisfactory for a large class of practical systems However the existence of time delay elements such as material or information transport of data renders such description unsatisfactory in accounting for important behaviors of many practical systems Indeed due largely to the current lack of effective methodology for analysis and control design for such systems the time delay elements are often either neglected or poorly approximated which frequently results in analysis and simulation of insufficient accuracy which in turn leads to poor performance of the systems designed Indeed it has been demonstrated in the area of automatic control that a relatively small delay may lead to instability or significantly deteriorated performances for the corresponding closed loop systems *Positive Systems*, 2006 **SIAM Journal on Control and Optimization** Society for Industrial and Applied Mathematics, 2009 **Mathematical Reviews**, 2008 **Nonnegative Matrices in Dynamic Systems** Abraham

Berman, Michael Neumann, Ronald J. Stern, 1989-10-31 This work applies the theory of nonnegative matrices to problems arising in positive differential and control systems There is a concise review of requisite material in convex analysis and matrix theory as well as a detailed review of linear differential and control systems Exposition incorporates simple real world dynamic models to better illustrate various aspects of the theory being developed Contains exercises **Dissertation**
