Computation Beyond Standard Models Shendan Jin, 2020 In the standard setting of online computation the input is not entirely available from the beginning but is revealed incrementally piece by piece as a sequence of requests Whenever a request arrives the online algorithm has to make immediately irrevocable decisions to serve the request without knowledge on the future requests Usually the standard framework to evaluate the performance of online algorithms is competitive analysis which compares the worst case performance of an online algorithm to an offline optimal solution In this thesis we

will study some new ways of looking at online problems First we study the online computation in the recourse model in which the irrevocability on online decisions is relaxed In other words the online algorithm is allowed to go back and change previously made decisions More precisely we show how to identify the trade off between the number of re optimization and the performance of online algorithms for the online maximum matching problem Moreover we study measures other than competitive analysis for evaluating the performance of online algorithms We observe that sometimes competitive analysis cannot distinguish the performance of different algorithms due to the worst case nature of the competitive ratio We demonstrate that a similar situation arises in the linear search problem More precisely we revisit the linear search problem and introduce a measure which can be applied as a refinement of the competitive ratio Last we study the online computation in the advice model in which the algorithm receives as input not only a sequence of requests but also some advice on the request sequence Specifically we study a recent model with untrusted advice in which the advice can be either trusted or untrusted Assume that in the latter case the advice can be generated from a malicious source We show how to identify a Pareto optimal strategy for the online bidding problem in the untrusted advice model
