*The Era of Assisted Reproductive Technologies Tailored to the Specific Necessities of Species, Industry and Case Reports*  
David Martín Hidalgo, 2021-08-16 Nowadays assisted reproductive technologies ARTs have a pivotal role not only in achieving fertilization in subfertile animals but they are also involved in the management of the herd decreasing disease spread and even allowing offspring sex selection Nonetheless there are differences between species or even within species that have led researchers worldwide to focus on those differences in order to bypass these specific difficulties This Special Issue titled The Era of Assisted Reproductive Technologies Tailored to the Specific Necessities of Species Industry and Case Reports and published in Animals is composed of 12 original manuscripts and three reviews that offer an overview of current and future ARTs used to improve reproductive outcomes mainly focused on farm animals such as horse pig bovine rabbit and ovine species Thus the Special Issue covers information from the classical point of view including comparative studies of different semen extenders to the most advanced technologies of sperm selection by thermotaxis or chemoattractants as well as the improvement of sperm features by red light irradiation The female and embryo contributions to ART outcomes are also covered for instance with a study that improves our knowledge by the metabolomic description of follicular fluid composition or the description of better culture conditions of oocytes In brief this Special Issue provides a balanced overview of emerging techniques and technologies used to preserve improve rescue or even create fertility for domestic farm animals with high economic impact

In the past decade advances in microscopy have been coupled with new methods of culturing and labeling cells to generate the new science of imaging. Imaging technologies allow investigators to look directly inside living cells and probe their form and function in unprecedented detail. This approach is revolutionizing many aspects of biomedical research, particularly neuroscience, in which visual techniques have traditionally been so important. This manual is the first comprehensive description of the range of imaging technologies being applied to living cells. With its origins in a laboratory course taught at Cold Spring Harbor Laboratory by the editors and contributors, it is packed with the kind of technical detail and practical advice that are essential for success yet seldom found in the research literature. It covers both established methods and cutting edge techniques such as multiphoton excitation microscopy and imaging of genetically engineered probes. Although it is neurons to which these technologies are most commonly applied, the methods described are readily adaptable to many other cell types. This book will therefore be an invaluable aid to investigators in cell and developmental biology and immunology as well as neuroscience who wish to take advantage of the extraordinary insights into cellular function offered by imaging technologies.
