**An Introduction to Cardiovascular Physiology** J R Levick, 2013-10-22 An Introduction to Cardiovascular Physiology is designed primarily for students of medicine and physiology This introductory text is mostly didactic in teaching style and it attempts to show that knowledge of the circulatory system is derived from experimental observations This book is organized into 15 chapters The chapters provide a fuller account of microvascular physiology to reflect the explosion of microvascular research and include a discussion of the fundamental function of the cardiovascular system involving the transfer of nutrients from plasma to the tissue They also

cover major advances in cardiovascular physiology including biochemical events underlying Starling's law of the heart, nonadrenergic noncholinergic neurotransmission, the discovery of new vasoactive substances produced by endothelium, and the novel concepts on the organization of the central nervous control of the circulation. This book is intended to medicine and physiology students.

*Circulatory System Dynamics* Abraham Noordergraaf, 2012-12-02. *Circulatory System Dynamics* reviews cardiovascular dynamics from the analytical viewpoint and indicates ways in which the accumulated knowledge can be expanded and applied to further enhance understanding of the normal mammalian circulation, to ascertain the nature of difficulties associated with disease, and to test the effect of treatment. Comprised of 10 chapters, this volume begins with an overview of the circulatory system including its anatomy and the trigger for myocardial heart muscle contraction. The discussion then turns to measurement of blood pressure using invasive and non-invasive techniques, blood flow measurement with emphasis on cardiac output and measurement in the microcirculation, the system and pulmonary arterial trees, and pulsatile pressure and flow in pulmonary veins. Subsequent chapters explore microcirculation and the anatomy of the microvasculature, the heart and coronary circulation, paying particular attention to the Frank-Starling mechanism and indices of myocardial contractility and control of blood pressure, peripheral resistance, and cerebral flow. The last two chapters deal with circulatory assistance and the closed cardiovascular system. This book will be of interest to students, practitioners, and researchers in fields ranging from physiology and biology to biochemistry and biophysics.

**The Circulatory System** The Open Courses Library, 2019-11-17. The Circulatory System Biology. Most animals are complex multicellular organisms that require a mechanism for transporting nutrients throughout their bodies and removing waste products. The circulatory system has evolved over time from simple diffusion through cells in the early evolution of animals to a complex network of blood vessels that reach all parts of the human body. This extensive network supplies the cells, tissues, and organs with oxygen and nutrients and removes carbon dioxide and waste, which are byproducts of respiration. Gas exchange is one essential function of the circulatory system. A circulatory system is not needed in organisms with no specialized respiratory organs because oxygen and carbon dioxide diffuse directly between their body tissues and the external environment. However, in organisms that possess lungs and gills, oxygen must be transported from these specialized respiratory organs to the body tissues via a circulatory system. Therefore, circulatory systems have had to evolve to accommodate the great diversity of body sizes and body types present among animals.
