The Role of Metadata in the Orchestration of Web Services Marlen Krebs, 2006-07-10 Diploma Thesis from the year 2006 in the subject Computer Science Software grade 1 3 Schmalkalden University of Applied Sciences language English abstract Orchestration is the study and practice of arranging music for an orchestra or musical ensemble In practical terms it consists of deciding which instruments should play which notes in a piece of music Wiki In musical terms the orchestra would be made up of Web services BPEL would be the sheet music and the business process manager BPM would be the composer that selects the necessary Web services and decides how they should interact with each other Organizations use Web services in two broad categories Enterprise Application Integration EAI and Business to Business B2B e commerce as well as less complex scenarios such as technical functions and information services common services This thesis provides an insight on how the

Web service standards resolve the limitations of conventional middleware and extend the benefits of process management to a wider scope of business problems Web service standards like SOAP XML WSDL and BPEL enable customers to solve integration problems easily by providing interoperability within a company or across multiple companies and improve B2B eCommerce and supply chain management by shifting to a service oriented paradigm in application development Web service orchestration provides an open standards base approach to create high level business processes such as workflows This thesis will focus on BPEL for describing the business logic although competing standards are still in use The steps for the workflow implementation will be explained on the basis of a sample procurement scenario

Web Services Gustavo Alonso,Fabio Casati,Harumi Kuno,Vijay Machiraju,2013-01-09 Like many other incipient technologies Web services are still surrounded by a substantial level of noise This noise results from the always dangerous combination of wishful thinking on the part of research and industry and of a lack of clear understanding of how Web services came to be On the one hand multiple contradictory interpretations are created by the many attempts to realign existing technology and strategies with Web services On the other hand the emphasis on what could be done with Web services in the future often makes us lose track of what can be really done with Web services today and in the short term These factors make it extremely difficult to get a coherent picture of what Web services are what they contribute and where they will be applied Alonso and his co authors deliberately take a step back Based on their academic and industrial experience with middleware and enterprise application integration systems they describe the fundamental concepts behind the notion of Web services and present them as the natural evolution of conventional middleware necessary to meet the challenges of the Web and of B2B application integration Rather than providing a reference guide or a how to write your first Web service kind of book they discuss the main objectives of Web services the challenges that must be faced to achieve them and the opportunities that this novel technology provides Established as well as recently proposed standards and techniques e g WSDL UDDI SOAP WS Coordination WS Transactions and BPEL are then examined in the context of this discussion in order to emphasize their scope benefits and shortcomings Thus the book is ideally suited both for professionals considering the development of application integration solutions and for research and students interesting in understanding and contributing to the evolution of enterprise application technologies
