

taking a more active role in making decisions about their own health care, has emerged together with health insurance plans shifting a greater share of expenses to patients. New models of shared decision making promise to bring greater emphasis to informed patient choice for “preference-sensitive” care (Wennberg et al., 2007). Indeed, new and better research could improve the quality, safety, and effectiveness of health care by providing both patients *and* their health care providers with the evidence to assist in informed decision making. To accomplish this, however, patient-focused research is needed to identify not only the population-level effects of health interventions, but also the patient-level predictors of both positive and negative outcomes and the role of patient preferences in making choices (CBO, 2008).

Beyond consumers and health care providers, those that bear substantial financial responsibility for the health care needs of populations need better evidence; they include employers, federal programs such as Medicare and Medicaid, and private insurers. These organizations must allocate resources across a panoply of medical services, procedures, and technologies in an attempt to maximize health benefits while keeping coverage affordable. Moreover, these organizations must function within a growing array of models for the delivery and financing of health care, many of which are not yet supported with robust evidence of effectiveness.

### Optimizing Evidence

#### *Study Populations Representative of Clinical Practice*

Many studies of the effects of medical interventions on health address efficacy rather than effectiveness. Efficacy reflects the degree to which an intervention produces the expected result under carefully controlled conditions chosen to maximize the likelihood of observing an effect if it exists. Many randomized controlled trials—generally considered to be the gold standard—are efficacy studies, particularly those conducted to win regulatory approval. The study population and setting of efficacy studies may differ in important ways from those settings in which the interventions are likely to be used. By contrast, effectiveness research intends to measure the benefits and harms of an intervention in ordinary settings and broader populations, and therefore can often be more relevant to policy evaluation and the health care decisions of providers and patients. Care needs to be taken, however, in effectiveness research such as observational, database, registry, and other studies to recognize that without randomization, unidentified bias and confounders may weaken the level of evidence, and that efficacy studies may be strengthened by broadening eligibility of populations or settings for trials and other attempts to increase generalizability.
