Neutron Stars and Pulsars Werner Becker,2009-02-11 Neutron stars are the most compact astronomical objects in the universe which are accessible by direct observation Studying neutron stars means studying physics in regimes unattainable in any terrestrial laboratory Understanding their observed complex phenomena requires a wide range of scientific disciplines including the nuclear and condensed matter physics of very dense matter in neutron star interiors plasma physics and quantum electrodynamics of magnetospheres and the relativistic magneto hydrodynamics of electron positron pulsar winds interacting with some ambient medium Not to mention the test bed neutron stars provide for general relativity theories and their importance as potential sources of gravitational waves It is this variety of disciplines which among others makes neutron star research so fascinating not only for those who have been working in the field for many years but also for students and young scientists The aim of this book is to serve as a reference work which not only reviews the progress made since the early days of pulsar astronomy but especially focuses on questions such as What have we learned about the subject and how did we learn it What are the most important open questions in this area and What new tools telescopes observations and calculations are needed to answer these questions All authors who have contributed to this book have devoted a significant part of their scientific careers to exploring the nature of neutron stars and understanding pulsars Everyone has paid special attention to writing educational comprehensive review articles with the needs of beginners students and young scientists as potential readers in mind This book will be a valuable source of information for these groups

*Neutron Stars and Pulsars (IAU S291)* Joeri van Leeuwen,2013-04-25 IAU Symposium 291 features a rich harvest of recent scientific discoveries and looks forward to the many exciting avenues for future neutron star research The volume starts with general lively comprehensive introductions to three main themes that successfully communicate the excitement of current pulsar research The subsequent reviews and contributions on hot topics cover ongoing searches for pulsars both radio and gamma ray neutron star formation and properties binary pulsars pulsar timing and tests of gravitational theories magnetars radio transients radio X ray and gamma ray pulse properties and emission mechanisms and future facilities This range of topics clearly illustrates the diverse nature and wide application of neutron star research Through a combination of introductory reviews and practically complete coverage of current results from across the electromagnetic spectrum IAU S291 is the perfect reference for neutron star researchers and also provides an excellent read for advanced undergraduate and starting graduate students

Neutron Stars and Pulsars Freeman J. Dyson,1971      **Timing Neutron Stars: Pulsations, Oscillations and Explosions** Tomaso M. Belloni,Mariano Méndez,Chengmin Zhang,2020-10-23 Neutron stars whether isolated or in a binary system display a varied and complex phenomenology often accompanied by extreme variability of many time scales which takes the form of pulsations due to the object rotation quasi periodicities associated to accretion of matter and explosions due to matter accreted on the surface or to starquakes of highly magnetized objects This book gives an

overview of the current observational and theoretical standpoint in the research on the physics under the extreme conditions that neutron stars naturally provide. The six chapters explore three physical regions of a neutron star: the space around it where accretion and pulsar companions allow testing of general relativity; its surface where millisecond pulsation and X-ray burts provide clues about general relativistic effects and the equation of state of neutron matter; its interior, of course, inaccessible to direct observations, can nevertheless be probed with all observational parameters related to neutron star variability.

**Neutron Stars and Their Birth Events** Wolfgang Kundt, 2012-12-06 This volume is the documentation of the second Course on Neutron Stars Active Galactic Nuclei and Jets held at Erice in September 1988. This second Course was devoted to our knowledge about neutron star sources. The poster spoke of pulsars accreting X-ray sources and jet englnes, perhaps also UHE pulsars X-ray bursters and black hole candidates. Neutron stars have even been proposed as the primary cosmic ray boosters. Most of theil properties are still controversial, such as their birth mechanism neutrino versus magnetic piston, internal structure neutrons quarks strange particles, magnetic thermal and spin histories, wind generation, hydrogen versus pair plasma radiation versus centrifugal pressure, magnetospheric structure and accretion modes along field lines, versus quasi Keplerian. The listed controversies have largely survived through the Course and entered into the proceedings. Several lecturers speak of magnetic field decay in neutron stars of the recycling of old pulsars and of accretion induced collapse of white dwarfs as though such processes were textbook knowledge. Terms and abbreviations like RPSR, recycled pulsar spinup line, AIC and ADC, accretion disk corona help to foster the assumptions. It is not clear to me at this time whether any of these notions has an application to reality.

*Neutron Stars: Theory and Observation* J.E. Ventura, David Pines, 1991-09-30 Some twenty three years after the discovery of pulsars and their identification as rotating neutron stars, neutron star physics may be regarded as coming of age. Pulsars and accreting neutron stars have now been studied at every wavelength from the initial radio observations through optical, X-ray up to the very recent observations in the TeV region, while theorists have studied in some detail relevant physical processes both outside and inside neutron stars. As a result,

comparison of theory with observation provides a test of our theoretical ideas in fields as diverse as neutron and nuclear matter, superfluidity and superconductivity, the acceleration of high energy particles and the generation and maintenance of intense magnetic fields. For example, through observations of glitches and post-glitch behavior of pulsars, it has become possible to establish the presence of superfluid neutron matter in the inner crust of neutron stars and to determine some of its properties. While neutron stars in compact binary systems offer one of the most efficient energy generation mechanisms known, it is in fact the interactive interpretation of these diverse pieces of information that can lead to major advances in our understanding of the physics of these exotic objects and justifies the characterization of neutron stars as hadron physics laboratories.

**The Electromagnetic Spectrum of Neutron Stars** Altan Baykal, Sinan K. Yerli, Sitki C. Inam, Sergei Grebenev, 2006-01-20 Neutron stars hold a central place in astrophysics not only because they are made up of the most

extreme states of the condensed matter but also because they are along with white dwarfs and black holes one of the stable configurations that stars reach at the end of stellar evolution Neutron stars posses the highest rotation rates and strongest magnetic fields among all stars They radiate prolifically in high energy electromagnetic radiation and in the radio band This book is devoted to the selected lectures presented in the 6th NATO ASI series entitled *The Electromagnetic Spectrum of Neutron Stars* in Marmaris Turkey on 7-18 June 2004 This ASI is devoted to the spectral properties of neutron stars Spectral observations of neutron stars help us to understand the magnetospheric emission processes of isolated radio pulsars and the emission processes of accreting neutron stars This volume includes spectral information from the neutron stars in broadest sense namely neutrino and gravitational radiation along with the electromagnetic spectrum We believe that this volume can serve as graduate level of text including the broad range of properties of neutron stars *The Physics and Astrophysics of Neutron Stars* Luciano Rezzolla, Pierre Pizzochero, David Ian Jones, Nanda Rea, Isaac Vidaña, 2019-01-09 This book summarizes the recent progress in the physics and astrophysics of neutron stars and most importantly it identifies and develops effective strategies to explore both theoretically and observationally the many remaining open questions in the field Because of its significance in the solution of many fundamental questions in nuclear physics astrophysics and gravitational physics the study of neutron stars has seen enormous progress over the last years and has been very successful in improving our understanding in these fascinating compact objects The book addresses a wide spectrum of readers from students to senior researchers Thirteen chapters written by internationally renowned experts offer a thorough overview of the various facets of this interdisciplinary science from neutron star formation in supernovae pulsars equations of state super dense matter gravitational wave emission to alternative theories of gravity The book was initiated by the European Cooperation in Science and Technology COST Action MP1304 Exploring fundamental physics with compact stars NewCompStar **Neutron Stars and Pulsars** International Astronomical Union. Symposium, 2013 *The Many Faces of Neutron Stars* R. Buccheri, Jan van Paradijs, M. A. Alpar, 1998-07-31 A survey of recent progress in research on neutron stars emphasising radio pulsars accreting neutron stars in X ray binaries and the rotation powered high energy emission from isolated neutron stars Among the subjects reviewed are the broad history of neutron star research the properties of high density matter in neutron stars thermal and magnetic field evolution dynamics of neutron star crusts and glitches detection of radio emission from pulsars radio pulsar population millisecond and binary radio pulsars gamma ray emission from radio pulsars accreting neutron stars and black holes in X ray binaries the recently discovered kHz oscillations in low mass X ray binaries anomalous X ray pulsars the Bursting Pulsar X ray emission from isolated neutron stars neutron star atmosphere coalescing neutron star binaries and gamma ray bursts *Rotation And Accretion Powered Pulsars* Pranab Ghosh, 2007-04-17 This book is an introduction to pulsars a key area in high energy astrophysics with continuing potential for fundamental discoveries Throughout the book runs the unifying thread of the evolutionary link between rotation powered pulsars and accretion powered pulsars a

milestone of modern astrophysics Early textbooks on pulsars dealt almost entirely with rotation powered ones while accounts of pulsars in volumes on X ray binaries focused almost exclusively on accretion powered ones This is the first textbook to treat these two kinds of pulsars simultaneously with equal importance stressing the fact that both are rotating magnetic neutron stars operating under different conditions during different parts of their lives It describes the observational properties of both kinds of pulsars summarizes our physical understanding of these properties and pays detailed attention to the physics of superdense matter which neutron stars are composed of as well as to the superfluidity which is expected to occur in neutron stars Evolution from rotation power to accretion power and vice versa are carefully described The effects of the strong magnetic fields of neutron stars on themselves their emission properties and their environments are discussed as are the origin and evolution of such magnetic fields Also treated is the superbly accurate verification of Einstein's theory of general relativity through timing studies of binary pulsars which led to the award of the Nobel Prize to Hulse and Taylor in 1993 On each topic the book starts with simple basic physical concepts and builds up the exposition to the point where the latest and most exciting developments become accessible to the reader *Neutron Stars* John Maxwell Irvine, 1978

Theory of Neutron Star Magnetospheres F. Curtis Michel, 1991 An incomparable reference for astrophysicists studying pulsars and other kinds of neutron stars Theory of Neutron Star Magnetospheres sums up two decades of astrophysical research It provides in one volume the most important findings to date on this topic essential to astrophysicists faced with a huge and widely scattered literature F. Curtis Michel who was among the first theorists to propose a neutron star model for radio pulsars analyzes competing models of pulsars radio emission models winds and jets from pulsars pulsating X ray sources gamma ray burst sources and other neutron star driven phenomena Although the book places primary emphasis on theoretical essentials it also provides a considerable introduction to the observational data and its organization Michel emphasizes the problems and uncertainties that have arisen in the research as well as the considerable progress that has been made to date **Timing Neutron Stars** H. Ögelman, E.P. van den Heuvel, 2012-12-06 The idea for organizing an Advanced Study Institute devoted largely to neutron star timing arose independently in three places at Istanbul Garching and Amsterdam when we became aware of each other's ideas we decided to join forces The choice of a place for the Institute in Turkey appealed much to us all and it was then quickly decided that Qe me would be an excellent spot When the preparations for the Institute started early in 1987 we could not have guessed how timely the subject actually was Of course the recently discovered QPO phenomena in accreting neutron stars and half a dozen binary and millisecond radio pulsars known at the time formed one of the basic motivations for organizing this Institute But none of us could have guessed that later in 1987 we were to witness the wonderful discovery of the binary and millisecond radio pulsars in globular clusters and as if Nature wished to give us a special present for this the discovery in March 1988 of a millisecond pulsar in an eclipsing binary system the first eclipsing radio pulsar ever found and the second fastest in the sky The discussion of this pulsar its formation

and fate was one of the highlights of this meeting especially since its discoverers were among the participants of the Institute and could provide us with first hand information *The Origin and Evolution of Neutron Stars* International Astronomical Union. Symposium, 1987-06-30 Proceedings of the 125th Symposium of the International Astronomical Union held in Nanjing China May 26 30 1986 **High-Energy Emission from Pulsars and their Systems** Nanda Rea, Diego F.

Torres, 2011-02-04 The aim of the inaugural meeting of the Sant Cugat Forum on Astrophysics was to address in a global context the current understanding of and challenges in high energy emissions from isolated and non isolated neutron stars and to confront the theoretical picture with observations of both the Fermi satellite and the currently operating ground based Cherenkov telescopes Participants have also discussed the prospects for possible observations with planned instruments across the multi wavelength spectrum e g SKA LOFAR E VLT IXO CTA and how they will impact our theoretical

understanding of these systems In keeping with the goals of the Forum this book not only represents the proceedings of the meeting but also a reflection on the state of the art in the topic Isolated Neutron Stars: From the Surface to the Interior

Silvia Zane, Roberto Turolla, Dany Page, 2007-06-25 This book is a collation of the contributions presented at a major conference on isolated neutron stars held in London in April 2006 Forty years after the discovery of radio pulsars it presents an up to date description of the new vision of isolated neutron stars that has emerged in recent years The great variety of isolated neutron stars from pulsars to magnetars is well covered by descriptions of recent observational results and presentations of the latest theoretical interpretation of these data **Pulsars** W. Sieber, R. Wielebinski, 1981-05-01 More

than a decade has passed since pulsars were discovered at Cambridge by J Bell and A Hewish The past 13 years have seen extensive and at first rather hectic research and a considerable amount of observational and theoretical knowledge has been accumulated Looking back over one decade of pulsar research it seems worth while to ask what the real impact of the detection was and if our view of the universe has changed as a result of this discovery The excitement of the first months and years has ebbed down considerably with the result that pulsar research has become the task of a few scientists working in small groups scattered over many countries As more and more knowledge was acquired pulsars changed eventually from the bizarre pulsing objects as they were considered in the beginning to more normal stars of astrophysical interest Still pulsars are the manifestation of matter in its most extreme form neutron star matter for which an equivalent can be found on earth only in the very nucleus of an atom Neutron stars were predicted quite early in the history of modern astrophysics and although many of their features were already known from theoretical studies astrophysicists were not sure if we had the slightest chance to actually see these objects It therefore took some time after the historical detection paper of Hewish and coworkers before astronomers became convinced that pulsars were neutron stars Clocks in the Sky Geoff McNamara, 2008-11-17 Pulsars are rapidly spinning neutron stars the collapsed cores of once massive stars that ended their lives as supernova explosions In this book Geoff McNamara explores the history subsequent discovery and contemporary

research into pulsar astronomy The story of pulsars is brought right up to date with the announcement in 2006 of a new breed of pulsar Rotating Radio Transients RRATs which emit short bursts of radio signals separated by long pauses These may outnumber conventional radio pulsars by a ratio of four to one Geoff McNamara ends by pointing out that despite the enormous success of pulsar research in the second half of the twentieth century the real discoveries are yet to be made including perhaps the detection of the hypothetical pulsar black hole binary system by the proposed Square Kilometre Array the largest single radio telescope in the world     **Neutron Stars and Pulsars** Freeman J.
