Mathematics Manual for Water and Wastewater Treatment Plant Operators, Second Edition Frank R.

Spellman, 2014-05-07 To properly operate a waterworks or wastewater treatment plant and to pass the examination for a waterworks wastewater operator's license it is necessary to know how to perform certain calculations. All operators at all levels of licensure need a basic understanding of arithmetic and problem solving techniques to solve the problems they typically encounter in the workplace. Hailed on its first publication as a masterly account written in an engaging, highly readable, user-friendly style, the *Mathematics Manual for Water and Wastewater Treatment Plant Operators, Second Edition* has been expanded and divided into three specialized texts that contain hundreds of worked examples presented in a step-by-step format. They are ideal for all levels of water treatment operators in training and practitioners studying for advanced licensure. In addition, they provide a handy desk reference and handheld guide for daily use in making operational math computations. This first volume, *Basic Mathematics for Water and Wastewater Operators*, introduces and reviews fundamental concepts critical to qualified operators. Presented at a basic level, this volume reviews fractions and decimals, rounding numbers, significant digits, raising numbers to powers, averages, proportions, conversion factors, flow, and detention time, and the areas and volumes of different shapes. It also explains how to keep track of units of measurement such as inches, feet, and gallons during the calculations. After building a strong foundation based on theoretical math concepts, the text moves on to applied math, basic math concepts applied in solving practical problems for both water and wastewater operations. The material is presented using clear explanations in manageable portions to make learning quick and easy, and illustrative real-world problems are provided that correlate to modern practice and design.

The overall objective of this study was to develop a 3-D numerical analysis for compressor casing treatment flowfields. The current version of the computer code resulting from this study is referred to as ADPAC Advanced Ducted Propfan Analysis Codes Version 7. This report is intended to serve as a computer program user's manual for the ADPAC code developed under Tasks 6 and 7 of the NASA Contract. The ADPAC program is based on a flexible multiple block grid discretization scheme permitting coupled 2-D/3-D mesh block solutions with application to a wide variety of geometries. Aerodynamic calculations

are based on a four stage Runge Kutta time marching finite volume solution technique with added numerical dissipation Steady flow predictions are accelerated by a multigrid procedure An iterative implicit algorithm is available for rapid time dependent flow calculations and an advanced two equation turbulence model is incorporated to predict complex turbulent flows The consolidated code generated during this study is capable of executing in either a serial or parallel computing mode from a single source code Numerous examples are given in the form of test cases to demonstrate the utility of this approach for predicting the aerodynamics of modern turbomachinery configurations
