*Distinct Element Modelling in Geomechanics* K.R. Saxena, 2018-12-20

Linear mathematical assumptions for procedures in other branches of engineering have little relevance for geoengineering which must accommodate non linear behaviors Contributors to eight papers apply the breakthrough numerical modeling Distinct Element Method Cundall late 1960s The design philosophy for structures or excavations in geotechnical engineering is different from that followed for fabricated materials like steel and concrete The designer has little data both with regard to geological weaknesses and strength and deformation characteristics of materials before finalizing the designs Also these

characteristics vary from place to place In situ stresses due to gravity and tectonics and transient forces imposed due to rainfall and earthquakes make the matter more complicated The pore waters carry the load initially before passing it on to the solids For the analytical procedure to be realistic it should account for large displacements and non linear behaviour including strain softening Because of these considerations the designers have followed procedures based on simplifying assumptions such as linear small strain elastoplastic behaviour Numerical procedures based on such assumptions though very popular in other branches of engineering have made little impact in geo engineering An attempt has been made in this book to compile the recent use of distinct element codes for solutions of some of the problems in geomechanics particularly those involving excavations It is hoped that it will provide an opportunity for the fraternity of geotechnical engineers to appreciate the opening of new frontiers in the use of computers for solving more challenging geotechnical problems

**Geomechanics and Geotechnics of Particulate Media** Masayuki Hyodo,Hidekazu Murata,Yukio Nakata,2017-12-14 Microscopic re examination of geomaterials consisting of aggregates can shed light on macroscopic behaviour including compressibility anisotropy yielding creep cyclic liquefaction and shear rupture As a result of this process of examination new methods of material characterization emerge leading to a greater degree of accuracy in the specification of new constitutive models with physically meaningful parameters The impetus behind this development is an increasing awareness on sustainability leading to the more efficient use of recycled materials for geotechnical applications The characteristics of recycled materials such as compressibility and self hardening may differ significantly from those of natural materials and it is crucial that evaluation is made from a specifically particulate perspective
