Beyer, 2008 **The Use of Long Term Pavement Performance Data for Quantifying the Relative Effects of Structural and Environmental Factors on the Response and Performance of New Flexible Pavements** Syed Waqar Haider, 2005 [Best Practices for Concrete Pavement Transition Design and Construction](#) Youn su Jung, Dan G. Zollinger, Shiraz D. Tayabji, 2007 This project conducted a survey of Texas Department of Transportation TxDOT and other state highway association SHA practices and identified the best practices toward incorporating them into guidelines for design and construction of transition areas that will enable TxDOT engineers and designers to avoid the inappropriate practices The types of transitions that were addressed in this report covered a variety of concrete pavement combinations Where possible observed performances were documented based on survey results of many district practices and the findings of field visits Based on these findings improvements of various transition types were suggested to enhance the design standard for different transition types Guidelines address the design of concrete pavements in transition areas with the joints and related details The study of specific joint configurations associated with

transitions was conducted with respect to stiffness of the joint potential for permanent deformation and slab restraint to translational movement at the joint The 11 most frequently constructed types of concrete pavement transitions are introduced in this paper and some of them have alternative designs as more options in the design guide *Evaluation of Hot Mix Asphalt Moisture Sensitivity Using the Nottingham Asphalt Test Equipment* R. Christopher Williams, Tamer M. Breakah, 2010 Pavements are subjected to different stresses during their design lives A properly designed pavement will perform adequately during its design life and the distresses will not exceed the allowable limits however there are several factors that can lead to premature pavement failure One such factor is moisture sensitivity AASHTO T 283 is the standard test used in the moisture susceptibility evaluation of asphalt mixtures but the results of the test are not very representative of the expected behavior of asphalt mixtures The dynamic modulus test measures a fundamental property of the mixture The results of the dynamic modulus test can be used directly in the Mechanistic Empirical Pavement Design Guide MEPDG and are considered a very good representation of the expected field performance of the mixture Further research is still needed to study how the dynamic modulus results are affected by moisture The flow number test was studied in previous research as a candidate test for moisture susceptibility evaluation but the results of that research were not favorable This research has four main objectives The first objective of this research is to evaluate the usefulness of the dynamic modulus and flow number tests in moisture susceptibility evaluation The second objective is to compare the results to those achieved using the AASHTO T 283 test The third objective is to study the effect of different methods of sample conditioning and testing conditions The fourth objective of the research is to study the variability in the test results **Calibrated Mechanistic Structural Analysis Procedures for Pavements: Appendices**, 1990
