Laboratory Evaluation of Rutting in Asphalt Pavements Khaled Ksaibati, Tyler Miller, Michael J. Farrar, 1996 The feasibility of using the Georgia Loaded Wheel Tester GLWT to predict rutting in the laboratory was investigated in this research The research was performed in two phases The first phase consisted of modifying the GLWT to handle 15 2 cm 6 in cores developing a laboratory compaction procedure for cores determining the optimum laboratory testing conditions and investigating the repeatability of the GLWT The second phase of the study included correlating rut depth values obtained with the GLWT to actual field rut depth values utilizing the GLWT to evaluate the effects of the asphalt additive SOMAT on asphalt concrete mixes and evaluating the rut resistance of Stone Matrix Asphalt SMA Results from the study show that the GLWT is capable of predicting rutting in asphalt pavements prior to construction In addition results from the GLWT correlate well with results from more expensive European Testers

Evaluation of Hot Mix Asphalt Moisture Sensitivity Using the Nottingham Asphalt Test Equipment R. Christopher

Williams, Tamer M. Breakah, 2010 Pavements are subjected to different stresses during their design lives. A properly designed pavement will perform adequately during its design life and the distresses will not exceed the allowable limits; however, there are several factors that can lead to premature pavement failure. One such factor is moisture sensitivity. AASHTO T 283 is the standard test used in the moisture susceptibility evaluation of asphalt mixtures, but the results of the test are not very representative of the expected behavior of asphalt mixtures. The dynamic modulus test measures a fundamental property of the mixture. The results of the dynamic modulus test can be used directly in the Mechanistic Empirical Pavement Design Guide (MEPDG) and are considered a very good representation of the expected field performance of the mixture. Further research is still needed to study how the dynamic modulus results are affected by moisture. The flow number test was studied in previous research as a candidate test for moisture susceptibility evaluation, but the results of that research were not favorable. This research has four main objectives. The first objective of this research is to evaluate the usefulness of the dynamic modulus and flow number tests in moisture susceptibility evaluation. The second objective is to compare the results to those achieved using the AASHTO T 283 test. The third objective is to study the effect of different methods of sample conditioning and testing conditions. The fourth objective of the research is to study the variability in the test results. **2nd International Conference on Bearing Capacity of Roads and Airfields** C.
