

Figure 2. A graph and its Adjacency Matrix.

The Adjacency Matrix, A , of a graph, G with $|V|$ vertices may be defined as $[A_{ij}]$ for $[V]$ matrix, $A = [a_{ij}]$, whose entries are elements such that the entry, $a_{ij} = 1$ if vertices i and j are joined by an edge for j vertices in G , and 0 if otherwise. (Bollobás et al., 1998). Other common graphs include: Block-diagonal (Bollobás, 1979b), Block-diagonal (Bollobás, 1979c) are generalizing the graph concept, many other apply. The Adjacency Matrix is a versatile tool for the development of simpler solutions approaches to network problems.

2. Aggregation and Graph Theory in Networks Problems

The graph concept allows for the configuration of some issue or network and the reconfiguration of the existing network, issue configuration and re-configuration structures (Ahuja, 1992; Barlow, 1997; Lusetti, 2000). It may also permit that decompositions of complex issue substructures for better and easier analysis. In practical terms the structures are simplified and broken up networks subgraphs. These network subgraphs may change with time via addition or subtraction of nodes or links to allow for decompositions and smaller substructures results in re-configuration and then rejoin. Furthermore changes may occur in a network structure and smaller subgraphs are also be link reorganization (Ahuja, 1992). Various algorithms have therefore been developed to serve as tools for appropriately defining network topologies depending on the specific problem objectives. These include: hierarchical clustering trees, shortest — route algorithms, maximum flow algorithms, minimum — cost assignment network algorithms. Applications of these methods have been reported widely and may be found in the works of Whiting (1999), Taha (2000a) and, Mousavi (2000a). The transportation, storage exchange/interconnection tree planning networks, Naujoks et al. (1999) is the transportation facility layout etc.

2.1. Fuzzy Transportation Network Case Study

A typical telecommunication systems (Barlow, 2000a), used for linking nodes and gate representation points is illustrated in Figure 3. It consists of a set of nodes which are the equipment such as station, telephone, switching, etc., ISDN, radio base, bridges and end nodes which are links used for connection of data communication. The original link capacities are as given on the left hand side of the nodes where the nodes 1, 2 and 3 are terminal concentrators. Figure 3, summarizes the operational topologies of the network for the connection of node 1 to nodes, possible loops 1.2.3.1, 1.3.2.1 and 1.2.2.1 are indicated. Such loops are capable of causing undesirable loops resulting in inefficient operation of the network. Figure 3 further shows the connections of the busy issue network, where all the nodes are interconnected and the distance between the nodes are indicated on the edges.

The objective of this paper, was to carry out performance analysis of the busy issue network communication network and their different performance topologies for the network, which effect for the best process no factors.

2.2 Performance of Analysis

It addresses the theory of system development analysis to either to select the most effective architecture or design constraints which drive a system to maximum performance. Different performance is concerned with measuring or estimating the parameters that represent.

The network behavior which is, most cases is the benchmark of what a system is capable of doing. The parameters of general interest are the network delay, throughput, link utilization etc. These parameters are consequently be measured in terms of transmission efficiency, reliability and operational cost of the network topologies (Barlow et al., 2000b; Elgammal et al., 2000a).
