engineering or formal methods It is also suitable in conjunction with other books in courses on hardware design discrete mathematics or theory especially courses stressing formalism rigor or mechanized support It is also appropriate for courses on artificial intelligence or automated reasoning and as a reference for business and industry Current hardware and software systems are often very complex and the trend is towards increased complexity Many of these systems are of critical importance therefore making sure that they behave as expected is also of critical importance By modeling computing systems mathematically we obtain models that we can prove behave correctly The complexity of computing systems makes such proofs very long complicated and error prone To further increase confidence in our reasoning we can use a computer program to check our proofs and even to automate some of their construction In this book we present A practical functional programming language closely related to Common Lisp which is used to define functions which can model computing systems and to make assertions about defined functions A formal logic in which defined functions correspond to axioms the logic is first order includes induction and allows us to prove theorems about the functions The computer aided reasoning system ACL2 which includes the programming language the logic and mechanical support for the proof process The ACL2 system has been successfully applied to projects of commercial interest including microprocessor modeling hardware verification microcode verification and software verification This book gives a methodology for modeling computing systems formally and for reasoning about those models with mechanized assistance The practicality of computer aided reasoning is further demonstrated in the companion book Computer Aided Reasoning ACL2 Case Studies Approximately 140 exercises are distributed throughout the book Additional material is freely available from the ACL2 home page on the Web including solutions to the exercises additional exercises case studies from the companion book research papers and the ACL2 system with detailed documentation   **Beginning Google Glass Development** Jeff Tang,2014-07-01 Beginning Google Glass Development is your number one resource for learning how to develop for Google Glass the paradigm shifting mobile computing platform taking the world by storm now and for years to come Mobile developers have always had to think for the future and right now that means getting started with Google Glass This book is incredibly hands on with many exciting projects You will learn the basics of Glass and how to set up your development environment through to every Glass development topic using Glass Development Kit GDK Glass User Interface Camera and Image Processing Video Basics and Applications Voice and Audio Network Bluetooth and Social Locations Map and Sensors Graphics Animation and Games You will also learn how to develop enterprise and web based Glass apps using the Mirror API Each topic is full of examples that illustrate what Glass can truly do and help you quickly start developing your own apps Jeff Tang has successfully developed mobile web and enterprise apps on many platforms and cares immensely about user experience He brings his vast knowledge to this book through cool and practical examples which will excite and tantalize your creativity This book is for any developer who is keen to start developing for Glass with GDK or the Mirror API Whether you are an Android iOS web or enterprise
