Nutritional Epidemiology:

Nutritional Epidemiology Walter Willett, 2012-11-07 This text is intended for those who wish to understand the complex relationships between diet and risks of important diseases such as cancer and cardiovascular disease. It is aimed both at researchers engaged in the unraveling of these complex relationships and at readers of the rapidly multiplying and often confusing scholarly literature on the subject. The book starts with an overview of research strategies in nutritional epidemiology, still a relatively new discipline that combines the vast knowledge compiled by nutritionists during the 20th century with the methodologies developed by epidemiologists to study the determinants of diseases with multiple etiologies and long latent periods. A major section is devoted to the methods of dietary assessment using data on food intake, biochemical indicators of diet and measures of body composition and size. The reproducibility and validity of each approach and the implications of measurement error are considered in detail. The analysis, presentation and interpretation of data from epidemiologic studies of diet and disease are explored in depth. Particular attention is paid to the important influence of total energy intake on findings in such studies. To illustrate methodological issues in nutritional epidemiology, relationships of dietary factors to the incidence of lung and breast cancer, heart disease and birth defects are examined in depth. The first edition of *Nutritional Epidemiology* published in 1989 was widely praised and quickly established itself as the standard reference in this field. The second edition published in 1998 added new chapters on the analysis and presentation of dietary data, nutritional surveillance and folic acid and neural tube defects. This new edition, in addition to substantial updating of existing chapters, includes new chapters on assessment of physical activity, nutrition and genetic epidemiology and the role of nutritional epidemiology in policy. This book will benefit epidemiologists, nutritionists, dietitians, policy makers, public health practitioners, oncologists and cardiovascular and other clinical specialists.

Design Concepts in Nutritional Epidemiology Barrie M. Margetts, Michael Nelson, 1997-04-24 In examining the relationship between nutritional exposure and disease aetiology, the importance of a carefully considered experimental design cannot be overstated. A sound experimental design involves the formulation of a clear research hypothesis and the identification of appropriate measures of exposure and outcome. It is essential that these variables can be measured with a minimum of error whilst taking into account the effects of chance and bias and being aware of the risk of confounding variables. The first edition of *Design Concepts in Nutritional Epidemiology* presented a thorough guide to research methods in nutritional epidemiology. Since publication of the 1st edition, we now have a much better understanding of the characteristics of nutritional exposure that need to be measured in order to answer questions about diet-disease relationships. The 2nd edition has been extensively revised to include the most up-to-date methods of researching this relationship. Included are new chapters on qualitative and sociological measures, anthropometric measures, gene-nutrient interactions and cross-sectional studies. *Design Concepts in Nutritional Epidemiology* will be an essential text for nutritionists and epidemiologists helping them in their quest to improve

the quality of information upon which important public health decisions are made *Modern Epidemiology* Kenneth J. Rothman, Sander Greenland, Timothy L. Lash, 2008 The thoroughly revised and updated Third Edition of the acclaimed *Modern Epidemiology* reflects both the conceptual development of this evolving science and the increasingly focal role that epidemiology plays in dealing with public health and medical problems Coauthored by three leading epidemiologists with sixteen additional contributors this Third Edition is the most comprehensive and cohesive text on the principles and methods of epidemiologic research The book covers a broad range of concepts and methods such as basic measures of disease frequency and associations study design field methods threats to validity and assessing precision It also covers advanced topics in data analysis such as Bayesian analysis bias analysis and hierarchical regression Chapters examine specific areas of research such as disease surveillance ecologic studies social epidemiology infectious disease epidemiology genetic and molecular epidemiology nutritional epidemiology environmental epidemiology reproductive epidemiology and clinical epidemiology Design Concepts in Nutritional Epidemiology Michael Nelson, 1997 In examining the relationship between nutritional exposure and disease aetiology the importance of a carefully considered experimental design cannot be overstated A sound experimental design involves the formulation of a clear research hypothesis and the identification of appropriate measures of exposure and outcome It is essential that these variables can be measured with a minimum of error whilst taking into account the effects of chance and bias and being aware of the risk of confounding variables The first edition of *Design Concepts in Nutritional Epidemiology* presented a thorough guide to research methods in nutritional epidemiology Since publication of the 1st edition we now have a much better understanding of the characteristics of nutritional exposure that need to be measured in order to answer questions about diet disease relationships The 2nd edition has been extensively revised to include the most up to date methods of researching this relationship Included are new chapters on qualitative and sociological measures anthropometric measures gene nutrient interactions and cross sectional studies *Design Concepts in Nutritional Epidemiology* will be an essential text for nutritionists and epidemiologists helping them in their quest to improve the quality of information upon which important public health decisions are made Nutrition in the Prevention and Treatment of Disease Ann M.
