

## TRANSFER SWITCH FUNCTION

Automatic transfer switches, capable of automatic operation without operator intervention, perform the basic function of transferring the load to the available source. The controller monitors each source for allowable voltage and frequency range. Transfer switches may interact with any of the Low-Works™ devices, such as:

- Generator Set
- Master Controller
- Annunciator Panel
- Circuit Breaker

The OTPC ATS supports utility-to-generator, utility-to-utility, and generator-to-generator applications.

### UTILITY-TO-GENSET OPERATION

In utility-to-genset applications, the transfer switch performs the following functions:

1. Senses the interruption of the Source 1 power.
2. Sends a start signal to the generator set (Source 2).
3. Transfers the load to the Source 2.
4. Senses the return of Source 1.
5. Retr transfers the load to Source 1.
6. Sends a stop signal to the generator set.

### UTILITY-TO-UTILITY OPERATION

In utility-to-utility applications, the transfer switch performs the following functions:

1. Senses the interruption of the Source 1 power.
2. Transfers the load to the Source 2.
3. Senses the return of Source 1.
4. Retr transfers the load to Source 1.

If one genset fails to operate within the specified range of voltage and frequency, the transfer switch automatically starts and connects the other genset.

Level 2 controllers can control a two-utility configuration for prime power. One utility is designated the preferred source. The control automatically transfers the load between the two utilities and detects alarm conditions.

The operator can select either source as the preferred source (see Figure 1-2). The Preferred Source menu is included in the Test submenus (see Figure 4-17). The PC service tool can also be used to designate either source as the preferred source.

**Note:** The exercise routine is not available in this configuration.

**FIGURE 1-2. PREFERRED SOURCE SUBMENU  
GENERATOR-TO-GENERATOR  
OPERATION**

In genset-to-genset applications, there are two possible configurations, as shown in Figure 1-3.

- Prime Power – Two gensets provide all of the power (utility power is not available)
- Dual Standby – Two gensets are used to back up utility power

In Prime Power genset-to-genset applications, the ATS performs the same as with utility-to-genset applications.

In Dual Standby genset-to-genset applications, the master and the slave ATSs perform the following functions.

1. The slave ATS begins connected to the preferred source (either genset A or B, but neither genset is operating yet) and monitors for the Stand-by Start signal from the master ATS (see Figure 1-3).
2. When the signal is received, the slave ATS starts the preferred genset.
3. If the preferred source voltage is acceptable, the slave ATS remains there and turns off the non-preferred genset. Otherwise, the slave ATS will transfer to the non-preferred source.
4. When the utility source returns on the master ATS, then it will transfer back to the utility and disables the Stand-by Start signal.
5. When the Stand-by Signal is disabled, the slave ATS turns off the operating genset (either genset A or B).
