

# STOMA CARE

A stoma is a surgically formed pathway, connecting internal organs to the external environment, enabling the passage of faeces or urine from the digestive or urinary tract. Around the opening is a flange that is used to attach the bag to the abdominal wall, whereby an ostomy pouch is required for collecting the expelled waste.

## STOMAS

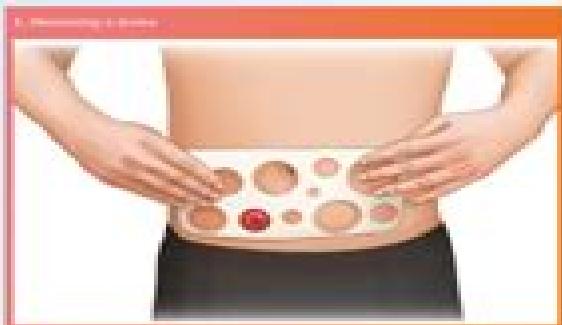

Stomas, which can be either temporary or permanent, are named based on their specific location and purpose. It is normal for the stoma to be red, moist, and can bleed slightly, and should not be painful due to them being no longer nerve supply. The three main types of abdominal stoma are:

- **Colostomy** – involves creating a stoma in the colon, or large intestine, allowing faeces to exit the body when the rectum or rectum and anus is resected. The location of the stoma will depend on which area of the colon has been diverted.
- **Ileostomy** – where a stoma is formed at the end of the small intestine, providing an alternative path for waste removal, including faecal and digestive fluids, when the natural route through the colon is dysfunctional or absent.
- **Urostomy** – often referred to as an ileal conduit, this procedure creates a stoma in the urinary system, enabling urine to bypass the bladder and exit the body through a surgically made opening in the abdominal wall, often necessary when the bladder is removed.

## PATIENT GUIDE TO STOMA CARE

Patients and their carers take on the responsibility of daily management tasks, including cleaning and self-management, involving their active involvement in stoma management. Additionally, it is important to be educated on proper stoma care practices, such as guidance about the use of cleaning agents, protective creams, solutions, bandages, or staples and the importance of regular pouch changes to prevent leaks.

This measuring guide has been set to be as close to the size-tailored as possible without making any contact with the stoma.
