*Output Regulation of Uncertain Nonlinear Systems* Christopher I Byrnes,Francesco Delli Priscoli,Alberto Isidori,1997-06-01    [Stabilization and Regulation of Nonlinear Systems](#) Zhiyong Chen,Jie Huang,2014-08-30 The core of this textbook is a systematic and self contained treatment of the nonlinear stabilization and output regulation problems Its coverage embraces both fundamental concepts and advanced research outcomes and includes many numerical and practical examples Several classes of important uncertain nonlinear systems are discussed The state of the art solution presented uses robust and adaptive control design ideas in an integrated approach which demonstrates connections between global stabilization and global output regulation allowing both to be treated as stabilization problems *Stabilization and Regulation of Nonlinear Systems* takes advantage of rich new results to give students up to date instruction in the central design problems of nonlinear control problems which are a driving force behind the furtherance of modern control theory and its application The diversity of systems in which stabilization and output regulation become significant concerns in the mathematical formulation of practical control solutions whether in disturbance rejection in flying vehicles or synchronization of Lorenz systems with harmonic systems makes the text relevant to readers from a wide variety of backgrounds Many exercises are provided to facilitate study and solutions are freely available to instructors via a download from [springerextras.com](http://springerextras.com) Striking a balance between rigorous mathematical treatment and engineering practicality *Stabilization and Regulation of Nonlinear Systems* is an ideal text for graduate students from many engineering and applied mathematical disciplines seeking a contemporary course in nonlinear control Practitioners and academic theorists will also find this book a useful reference on recent thinking in this field    *Stability and Stabilization* William J. Terrell,2009-01-26 Stability and Stabilization is the first intermediate level textbook that covers stability and stabilization of equilibria for both linear and nonlinear time invariant systems of ordinary differential equations Designed for advanced undergraduates and beginning graduate students in the sciences engineering and mathematics the book takes a unique modern approach that bridges the gap between linear and nonlinear systems Presenting stability and stabilization of equilibria as a core problem of mathematical control theory the book emphasizes the subject's mathematical coherence and unity and it introduces and develops many of the core concepts of systems and control theory There are five chapters on linear systems and nine chapters on nonlinear systems an introductory chapter a mathematical background chapter a short final chapter on further reading and appendixes on basic analysis ordinary differential equations manifolds and the Frobenius theorem and comparison functions and their use in differential equations The introduction to linear system theory presents the full framework of basic state space theory providing just enough detail to prepare students for the material on nonlinear systems Focuses on stability and feedback stabilization Bridges the gap between linear and nonlinear systems for advanced undergraduates and beginning graduate students Balances coverage of linear and nonlinear systems Covers cascade systems

**Nonlinear Systems** Shankar Sastry, 2013-04-18 There has been a great deal of excitement in the last ten years over the emergence of new mathematical techniques for the analysis and control of nonlinear systems. Witness the emergence of a set of simplified tools for the analysis of bifurcations, chaos and other complicated dynamical behavior and the development of a comprehensive theory of geometric nonlinear control. Coupled with this set of analytic advances has been the vast increase in computational power available for both the simulation and visualization of nonlinear systems as well as for the implementation in real time of sophisticated real time nonlinear control laws. Thus technological advances have bolstered the impact of analytic advances and produced a tremendous variety of new problems and applications that are nonlinear in an essential way. Nonlinear control laws have been implemented for sophisticated flight control systems on board helicopters and vertical take off and landing aircraft. Adaptive nonlinear control laws have been implemented for robot manipulators operating either singly or in cooperation on a multi-fingered robot hand. Adaptive control laws have been implemented for jet engines and automotive fuel injection systems as well as for automated highway systems and air traffic management systems to mention a few examples. Bifurcation theory has been used to explain and understand the onset of flutter in the dynamics of aircraft wing structures, the onset of oscillations in nonlinear circuits, surge and stall in aircraft engines, voltage collapse in a power transmission network.

*From Static to Dynamic Couplings in Consensus and Synchronization Among Identical and Non-Identical Systems* Peter Wieland, 2010 In a systems theoretic context the terms consensus and synchronization both describe the property that all individual systems in a group behave asymptotically identical, i.e. output or state trajectories asymptotically converge to a common trajectory. The objective of the present thesis is an improved understanding of some of the diverse coupling mechanisms leading to consensus and synchronization. A starting point is the observation that classical consensus and synchronization results commonly deal with two distinct facets of the problem. Consensus has regularly a strong focus on the interconnections and related constraints while synchronization typically addresses questions about complex individual dynamical systems. Very few results exist that address both facets simultaneously. A thorough analysis of static couplings in consensus algorithms provides explanations for this observation by unveiling limitations inherent to this type of couplings. Novel dynamic coupling mechanisms are proposed to overcome these limitations. These methods essentially rely on an internal model principle for consensus and synchronization derived in the thesis. This principle provides necessary conditions for consensus and synchronization in groups of non-identical systems and it establishes a link to the output regulation problem. The fresh point of view revealed by this link eventually leads to a new hierarchical mechanism for consensus and synchronization among complex non-identical systems with weak assumptions on the interconnections. Applications include synchronization of linear systems and phase synchronization of nonlinear oscillators.
