

$$\text{Percentage loss of prestress due to friction} = \frac{49.357}{1200.000} \times 100 = 4.113\%$$

$$\text{Percentage loss of prestress due to anchorage} = \frac{63.902}{1200.000} \times 100 = 5.325\%$$

Note that the anchorage loss is calculated at the jacking end since it has maximum value at this location, while friction loss is calculated for the half length of the tendon (Since jacking force is applied at both ends).

Int. du Béton,2014 In 1994 fib Commission 6 Prefabrication edited a successful Planning and Design Handbook that ran to approximately 45 000 copies and was published in Spanish and German Nearly 20 years later Bulletin 74 brings that first publication up to date It offers a synthesis of the latest structural design knowledge about

precast building structures against the background of 21st century technological innovations in materials production and construction. With it we hope to help architects and engineers achieve a full understanding of precast concrete building structures the possibilities they offer and their specific design philosophy. It was principally written for non seismic structures. The handbook contains eleven chapters each dealing with a specific aspect of precast building structures. The first chapter of the handbook highlights best practice opportunities that will enable architects design engineers and contractors to work together towards finding efficient solutions which is something unique to precast concrete buildings. The second chapter offers basic design recommendations that take into account the possibilities restrictions and advantages of precast concrete along with its detailing manufacture transport erection and serviceability stages. Chapter three describes the precast solutions for the most common types of buildings such as offices sports stadiums residential buildings hotels industrial warehouses and car parks. Different application possibilities are explored to teach us which types of precast units are commonly used in all those situations. Chapter four covers the basic design principles and systems related to stability. Precast concrete structures should be designed according to a specific stability concept unlike cast in situ structures. Chapter five discusses structural connections. Chapters six to nine address the four most commonly used systems or subsystems of precast concrete in buildings namely portal and skeletal structures wall frame structures floor and roof structures and architectural concrete facades. In chapter ten the design and detailing of a number of specific construction details in precast elements are discussed for example supports corbels openings and cutouts in the units special features related to the detailing of the reinforcement and so forth. Chapter eleven gives guidelines for the fire design of precast concrete structures. The handbook concludes with a list of references to good literature on precast concrete construction.

**Concrete Construction Engineering Handbook** Edward G. Nawy, 1997-09-26. This new handbook fills the need for in depth coverage of concrete construction engineering and technology. It features discussions on what design engineers and contractors need to know about concrete materials and systems one of the most versatile materials available. The Concrete Construction Engineering Handbook focuses on these important topics.
