Continuous Glucose Monitoring: Beyond Diabetes Management Ma Jianhua, Gang Hu, Jianzhong Xiao, 2025-09-29

Continuous glucose monitoring CGM is considered as a new tool for diabetes management. Due to the improved accuracy and reliability, its applications have grown. CGM provides us with an approach for getting insight into blood glucose profiles. Time in range (TIR), time above range (TAR), and time below range (TBR) become new targets for diabetes care. It helps to optimize the treatment regimen by preventing glucose fluctuation, especially hypoglycemia. In this context, a lot of studies have been done and many research papers have been published. As we know, blood glucose fluctuates during the day not only in patients with diabetes but also in other situations. The fluctuation reflects the balance of disposition of glucose, i.e., the appearance of glucose from gut, liver, and other glucogenesis tissues and the utilization of glucose. These processes are related to diverse mechanisms and physiological and pathophysiological events. As a result, GCM could be used in nutrition consultation, intensive care, prediabetes management, perioperative care, insulinoma, and other diseases related to glucose metabolism. In the discovery of new drugs, CGM could be used in animal studies to present a tool to find dynamic glucose metabolism.

Understanding Obesity to Determine the Best Therapeutic Option: From Lifestyle Interventions to Therapies Evelyn

Frias-Toral, Jorge Carriel-Mancilla, Florencia Ceriani, Almino Ramos, 2025-02-21. We are currently facing an obesity pandemic that affects individuals of all age groups, geographic areas, and social status among others. Thus, it is essential to generate high quality scientific evidence to better understand this pathology, its risk factors, and its treatments. Several modifiable and non-modifiable risk factors for the development of obesity have been identified. It has been demonstrated that obese patients have an increased risk of acquiring arterial hypertension, diabetes, dyslipidemia, cardiovascular diseases, cancer, and other chronic conditions. In order to take efficient actions to reverse or prevent these complications, it is also crucial to delve into body composition, lean mass, fat, bone mass, and sarcopenia in patients with obesity. In recent months, there have been developments in pharmacological therapies using GLP-1, GIP, and glucagon agonists, which seem to change the rules of the game regarding therapeutic decision making in these patients worldwide. However, surgical techniques such as sleeve gastrectomy and Roux-en-Y gastric bypass continue to be the most effective and definitive interventions to achieve adequate weight loss in patients with obesity. Despite the pharmacological development, none of the clinical trials have shown that the operated patients reach more than 30% of the total body weight as with bariatric surgery techniques. Furthermore, it is fundamental to analyze the impact of diverse therapeutic, non-surgical, and non-pharmacological options to address obesity, such as cognitive behavioral interventions and different types of diets in combination with physical activity.
