Handbook of Dynamical Systems B. Fiedler, 2002-02-21 This handbook is volume II in a series collecting mathematical state of the art surveys in the field of dynamical systems. Much of this field has developed from interactions with other areas of science and this volume shows how concepts of dynamical systems further the understanding of mathematical issues that arise in applications. Although modeling issues are addressed the central theme is the mathematically rigorous investigation of the resulting differential equations and their dynamic behavior. However the authors and editors have made an effort to ensure readability on a non technical level for mathematicians from other fields and for other scientists and engineers. The eighteen surveys collected here do not aspire to encyclopedic completeness but present selected paradigms. The surveys are grouped into those emphasizing finite dimensional methods numerics topological methods and partial differential equations. Application areas include the dynamics of neural networks fluid flows nonlinear optics and many others. While the survey articles can be read independently they deeply share recurrent themes from dynamical systems. Attractors bifurcations center manifolds dimension reduction ergodicity homoclinicity hyperbolicity invariant and inertial manifolds normal forms recurrence shift dynamics stability to name just a few are ubiquitous dynamical concepts throughout the articles.
