

# Guidelines for the Provision of Nutrition Support Therapy in the Adult Critically Ill Patient: American Society for Parenteral and Enteral Nutrition Guideline Questions, Evidence Grades, Recommendations, and Clinical Applications<sup>2</sup>

In the United States, there are currently about 80,000 adult intensive care hospital beds with an average of 75% capacity depending on region.<sup>3</sup> Most of these critically ill patients are unable to consume nutrition orally and artificial nutrition is often provided. The purpose of this guideline is to summarize the evidence within nutrition support to guide practitioners in their provision of artificial nutrition to critically ill patients. These key questions that had GRADE level evidence are presented with an evidence-based recommendation and clinical application discussion.<sup>2</sup> For questions not addressed in this guideline, follow the 2016 guidelines until a clinical recommendations paper is published.<sup>2</sup>

## GUIDELINE QUESTION 1

In adult critically ill patients, does provision of higher versus lower energy intake impact clinical outcomes?

**GRADE Recommendation:** No significant difference in clinical outcomes was found between patients with higher vs. lower levels of energy intake. We suggest feeding between 12-25 kcal/kg (i.e., the range of mean energy intakes examined) in the first 7-10 days of ICU stay.

**Evidence grade:** Moderate

**Strength of GRADE Recommendation:** Weak

**Discussion on Clinical Application for Question 1:** Until data become available that enable more precise recommendations on energy intake, clinicians should rely on clinical judgement. When EN or PN is associated with problems in glycemic control, respiratory acidosis or high serum triglyceride concentrations, consider whether feedings should be reduced. Lipid-based sedation also provides a source of kcal that should be considered in the total daily intake. Gastrointestinal tolerance may limit how much EN can be provided. Feeding less than the EN formula volume needed to deliver Dietary Reference Intake levels may risk inadequate vitamin, mineral, and trace element intake.

## GUIDELINE QUESTION 2

In adult critically ill patients, does provision of higher as compared to lower protein intake impact clinical outcomes?

**GRADE Recommendation:** There was no difference in clinical outcomes in the relatively limited data. Due to a paucity of trials with high-quality evidence, we cannot make a new recommendation at this time beyond the 2016 guideline suggestion for 1.2-2.0 g/kg/day.

**Evidence Grade:** Low

**Strength of GRADE recommendation:** Weak

**Discussion on Clinical Application for Question 2:** Few studies have investigated the impact of higher protein doses provided with equivalent energy, thus the impact on outcomes is not known. Until more data are available, we suggest clinicians should individualize protein prescriptions based on clinician judgment of estimated needs.

## GUIDELINE QUESTION 3

In adult critically ill patients who are candidates for EN, does similar caloric intake by PN versus EN as the primary feeding modality in the first week of critical illness impact clinical outcomes?

**GRADE Recommendation:** There was no significant difference in clinical outcomes. Since similar caloric intake provided as PN is not superior to EN and no differences in harm were identified, we recommend that either PN or EN is acceptable.

**Evidence grade:** High

**Strength of GRADE Recommendation:** Strong

**Discussion on Clinical Application for Question 3:** Our findings indicate that when similar energy is delivered by PN or EN early in critical illness for relatively short periods of time, clinical outcomes are similar. Given these data, cost and convenience of providing EN versus PN may be larger determinants of route of feeding early in critical illness than differences in clinical outcomes. The question of PN use arises when EN is not feasible or tolerated or in patients with significant gastrointestinal disease which were not the populations studied for question 3. The two reported trials gave approximately 18-20 kcal/kg/day and 0.6-0.8 g protein/kg/day, and both used a premixed PN solution. Avoidance of energy overfeeding may be the most important decision to make regarding PN use. Optimal glycemic control and catheter care are also important factors in the provision of PN to reduce infectious complications. Clinical judgment about an individual patient's metabolic tolerance to the dextrose (monitor glycemic control), ILE (monitor serum triglyceride concentrations), and amino acid dose is key to delivery of appropriate PN feedings.
