Determining the College

Football Playoff: Weighted Wins, A Better Approach Ray D. Theis,Mark G. Terwilliger,2021-09-21 In this book we explore the history of college football and in particular the mythical college championship from 1869 to the present day For several years different media outlets took it upon themselves to declare a national championship which led to nothing short of confusion In one year four different teams were named champion This chaotic situation and accompanying controversy ultimately led to the creation of the Bowl Championship Series or BCS Initially the BCS selection was based on a formula that incorporated several polls and computer models However the proprietary nature of the computer models and the complexity of the mathematics used to combine the data sources to arrive at the final selection did very little to quiet the controversy This led to the creation of a selection committee to choose the four best teams to compete in a four team playoff Again controversy has ensued with many questioning the politics and nebulous capricious nature of the criteria We have created an alternate model which we have dubbed the weighted wins system that defines a simple unbiased and consistent mechanism for evaluating and comparing the records of the teams in the NCAA s Bowl Subdivision We have compared the results of the weighted wins model against forty years of actual game results and found that it generates very similar outcomes The primary difference is that it completely removes politics from the selection process and offers a clear path to the playoffs for all members of the Bowl Subdivision

Comprehensive Evaluation of Various Training Protocols for Youth: Effects on

Body Composition, Hemodynamics, and Motor Performance Jarosław Domaradzki,Cristian Alvarez,Natalia Danek,Dawid Koźlenia,2025-08-21 The prevalence of obesity high blood pressure insulin resistance and diabetes among youth and young adults is alarmingly high in many countries primarily driven by physical inactivity and unhealthy lifestyles Despite the efforts of current health institutions and professionals effectively addressing these disorders remains a significant challenge Clinical and scientific research has demonstrated that specific exercise modalities such as high intensity interval training HIIT resistance training RT and concurrent training CT can significantly improve cardiometabolic health by providing cardiovascular metabolic and endocrine benefits through the stimulation of skeletal muscle mass and the cardiorespiratory system However the implementation of these interventions in children adolescents and young adults remains underexplored Additionally there is a gap in research focusing on the varying responsiveness to different exercise interventions especially among those who do not respond to exercise stimuli non responders Crucially understanding how early life interventions impact health outcomes into adulthood is essential for developing long term public health strategies
