

Figure 3. Example from Long Island Index interactive map material, highlighting how the dynamic transparency tool reveals aerial photography layered underneath a layer of land parcel boundaries shaded categorically by land use.

It is also important to consider the power of the transparency tool in the context of the transition from semi-transparent tool to the next. Testing the transparency of a layer at a particular percentage using the transparency slider reveals the map patterns of the underlying layer. But watching the transition from 0% to 50% transparency, for example, makes the transparency “come alive”. As a recent web design handbook notes,

Things move smoothly in the real world. They do not “pop up”. Transitions smooth out the jarring world of the Web, making changes appear more natural. (Brown, 2008)

This also addresses a potential concern with map transparency. Once a map layer becomes partly transparent, the semi-transparent map colors no longer match the legend; they are influenced by the underlying map layer(s). We understood this concern when we developed the Long Island Index application, but hoped that applications were useful enough that someone used they could the tool and modify their expectations accordingly (for example, another map developer using transparency correctly notes that “The transparency control lets mapmakers decide what works and what doesn’t.” - khanmap.com, 2008). We have also created video tutorials and “frequently asked questions” of AQIS web pages that address this issue.

Other AQIS tools included in the EIR 95 framework that we applied to the Long Island Index application include:

- Interactive legend items that control the display of map elements without having to check a legend box and then separately click a “refresh map” button (cf. “map legends” in Cross, 2008a) and
- Data panels that operate independently of the map, but also control the map display. In particular, the Long Island Index includes an option to display “regional views” of pre-selected data elements. The Regional Views tool opens a panel that floats on the map (it can be moved or collapsed by the user). This panel includes a pull-down list that will change the map display by highlighting communities that meet certain criteria, such as all the villages across Long Island with more than 10% population growth from 1990 to 2000. Clicking a

community shows in the resulting data list with a legend that community’s detailed profile and highlights it on the map. Double-clicking on the community will cause the map to zoom to the community’s location. Clicking the “zoom out” option in the panel will cause the map to zoom to the full extent of Long Island, showing the regional patterns of the selected data item.

Figure 4. Example from Long Island Index interactive map material, demonstrating how AQIS-style data items are linked with map navigation.

6. REPLICABLE AND EXTENSIBLE

The Long Island Index interactive map application is replicable and extensible. With modest effort it can be modified to focus on other urban regions, and can be extended to include other visualization tools such dynamic charts and timeline controls.

Though it relies in part on proprietary software, other organizations without access to proprietary backend database and map development systems can substitute open source applications making the overall architecture 100% reliant on open source technologies.

Similarly, although the choice of variables and view domains is pre-selected, with slight modification the platform can be designed to accommodate user-generated data, web services, and other dynamic content.

6. CONCLUSIONS

The interactive map was launched in December 2008. Since then several thousand individuals, local officials, community leaders, and industry representatives worldwide have used it. Scores of firms, and people can sign up for updates to the feature is expanded. Tutorials are available online for quick reference on how to navigate the maps and access the data.

The application is its own compensation for intelligently-designed workflow, with a focused goal of illuminating regional and local planning issues across Long Island by visualizing patterns in new ways. It represents a novel implementation of multiple online mapping and web navigation technologies and techniques, customized specifically for displaying aggregated administrative data such as Census statistics at the block group level and education data at the school district level plan.
