Emissions Benefits of Electric Vehicles in Uber and Lyft Services Alan Jenn,2019 Integrating electric vehicles EVs into vehicle fleets deployed by transportation network companies TNCs e.g. Uber and Lyft is a particularly promising way to realize the benefits of vehicle electrification due to the greater average miles traveled and passenger occupancy of TNC fleets In this report we examine EV use in TNC fleets from 2016 through 2018 We leverage novel datasets from TNCs as well as from charging service providers e.g. Chargepoint and EVGo to analyze charging and use patterns of EVs within TNC fleets These insights allow us to quantify the emissions benefits of EV use within TNC fleets assess the capability of EVs to perform TNC services and understand the effects of EV use within TNC fleets on the charging behavior of non TNC EVs We find the emission benefits of electrifying a vehicle in a TNC fleet are nearly three times greater than the benefits from electrifying a privately owned vehicle *Below the Line* Harold A. Integrating Automated Electric Vehicles into a Mobility-as-a-Service Ecosystem and Effects on Traditional Transportation and Ownership Joachim Taiber,Raivo Sell,2019-12-20 The current business model of the automotive industry is based on individual car ownership yet new ridesharing companies such as Uber and Lyft are well capitalized to invest in large commercially operated on demand mobility service vehicle fleets Car manufacturers like Tesla want to incorporate personal car owners into part time fleet operation by utilizing the company s fleet service These robotaxi fleets can be operated profitably when the technology works in a reliable manner and regulators allow driverless operation Although Mobility as a Service MaaS models of private and commercial vehicle fleets can complement public transportation models they may contribute to lower public transportation ridership and thus higher subsidies per ride This can lead to inefficiencies in the utilization of existing public transportation infrastructure MaaS platforms can also cause a reduced reliance on parking infrastructure e g street parking lanes and parking garages which can contribute to an improvement in overall traffic flow and a reduction in capital investment for commercial and residential real estate development Urban planning can be better centered around the true mobility needs of the citizens without sacrificing valuable space for vehicles that are inactive most of the time A key challenge is the transition phase where traditional forms of car ownership and transportation coexist with new forms of mobility services before true MaaS platforms are fully optimized Another fundamental issue is determining the true cost of car ownership and establishing ideal cost structures for on demand mobility services in order to replace the need of owning a car This needs to occur without compromising subsidized public transportation which provides affordable transportation for low income groups NOTE SAE EDGE Research Reports are intended to identify and illuminate key issues in emerging but still unsettled technologies of interest to the mobility industry
