*Numerical Linear Algebra for Applications in Statistics* James E. Gentle, 2012-12-06 Numerical linear algebra is one of the most important subjects in the field of statistical computing. Statistical methods in many areas of application require computations with vectors and matrices. This book describes accurate and efficient computer algorithms for factoring matrices, solving linear systems of equations, and extracting eigenvalues and eigenvectors. Although the book is not tied to any particular software system, it describes and gives examples of the use of modern computer software for numerical linear algebra. An understanding of numerical linear algebra requires basic knowledge both of linear algebra and of how numerical data are stored and manipulated in the computer. The book begins with a discussion of the basics of numerical computations and then describes the relevant properties of matrix inverses, matrix factorizations, matrix and vector norms, and other topics in linear algebra. Hence the book is essentially self-contained. The topics addressed in this book constitute the most important material for an introductory course in statistical computing and should be covered in every such course. The book includes exercises and can be used as a text for a first course in statistical computing or as supplementary text for various courses that emphasize computations. James Gentle is University Professor of Computational Statistics at George Mason University. During a thirteen year hiatus from academic work before joining George Mason, he was director of research and design at the world's largest independent producer of Fortran and C general purpose scientific software libraries. These libraries implement many algorithms for numerical linear algebra. He is a Fellow of the American Statistical Association and member of the International Statistical Institute. He has held several national

**Matrix Algebra** James E. Gentle, 2024-03-07 This book presents the theory of matrix algebra for statistical applications, explores various types of matrices encountered in statistics, and covers numerical linear algebra. Matrix algebra is one of the most important areas of mathematics in data science and in statistical theory, and previous editions had essential updates and comprehensive coverage on critical topics in mathematics. This 3rd edition offers a self-contained description of relevant aspects of matrix algebra for applications in statistics. It begins with fundamental concepts of vectors and vector spaces, covers basic algebraic properties of matrices, and analytic properties of vectors and matrices in multivariate calculus, and concludes with a discussion on operations on matrices in solutions of linear systems and in eigenanalysis. It also includes discussions of the R software package with numerous examples and exercises. Matrix Algebra considers various types of matrices encountered in statistics, such as projection matrices and positive definite matrices, and describes special properties of those matrices as well as describing various applications of matrix theory in statistics, including linear models, multivariate analysis, and stochastic processes. It begins with a discussion of the basics of numerical computations and goes on to describe accurate and efficient algorithms for factoring matrices, how to solve linear systems of equations, and the extraction of eigenvalues and eigenvectors. It covers numerical linear algebra, one of the most important subjects in the field of statistical computing. The content includes greater

emphases on R and extensive coverage of statistical linear models Matrix Algebra is ideal for graduate and advanced undergraduate students or as a supplementary text for courses in linear models or multivariate statistics It s also ideal for use in a course in statistical computing or as a supplementary text for various courses that emphasize computations
