Vibrio are Gram negative bacteria that naturally inhabit riverine estuarine and marine aquatic environments Some Vibrio are known to be capable of causing gastroenteritis wound infections cholera and fatal septicemia in severe cases Over the past decades research on Vibrio has increased and has caused a great development in our knowledge of these pathogens Focus of this research includes the discovery of emerging epidemic clones the traits of new strains and the occurrence of multidrug resistant strains in the ecology Moreover improved understandings of the prevalence pathogenesis and evolution of Vibrio have revealed the significant role of these pathogens in enhancing disease transmission The complete genomic sequences of Vibrio have been determined in providing a rich set of data illuminating the metabolic versatility of the species This book is dedicated to improving our knowledge and understanding not solely focusing into the prevalence detection pathogenesis virulence pandemic clones and multidrug resistance but also looking at the management of the multidrug resistance through different strategies such as non antibiotic resistant strategies that involved the application of knowledge in bacteriophages

**Systems Biology of Microbial Infection** Reinhard Guthke,Jörg Linde,Marc Thilo Figge,Franziska Mech, The systems biology of microbial infections aims at describing and analysing the confrontation of the host with bacterial and fungal pathogens It intends to understand and to model the interaction of the host in particular the immune system of humans or animals with components of pathogens This comprises experimental studies that provide spatio temporal data from monitoring the response of host and pathogenic cells to perturbations or when interacting with each other as well as the integrative analysis of genome wide data from both the host and the pathogen In perspective the host pathogen interaction should be described by a combination of spatio temporal models with interacting molecular networks of the host and the pathogen The aim is to unravel the main mechanisms of pathogenicity to identify diagnostic biomarkers and potential drug targets and to explore novel strategies for personalized therapy by computer simulations Some microorganisms are part of the normal microbial flora existing either in a mutualistic or commensal relationship with the host Microorganisms become pathogenic if they possess certain physiological characteristics and virulence determinants as well as capabilities for immune evasion Despite the different pathogenesis of infections there are several common traits 1 Before infection pathogens must be able to overcome epithelial barriers The infection starts by adhesion and colonization and is followed by entering of the pathogen into the host through the mucosa or injured skin 2 Next infection arises if the pathogen multiplies and overgrows the normal microbial flora either at the place of entrance or in deeper tissue layers or organs 3 After the growth phase the

pathogen damages the host's cells, tissues and organs by producing toxins or destructive enzymes. Thus, systems biology of microbial infection comprises all levels of the pathogen and the host's immune system. The investigation may start with the pathogen, its adhesion and colonization at the host, its interaction with host cell types (e.g. epithelial cells, dendritic cells, macrophages, neutrophils, natural killer cells, etc.). Because infection diseases are mainly found in patients with a weakened immune system (e.g. reduced activities of immune effector cells or defects in the epithelial barriers), systems biology of infection can also start with modelling of the immune defence, including innate and adaptive immunity. Systems biological studies comprise both experimental and theoretical approaches. The experimental studies may be dedicated to reveal the relevance of certain genes or proteins in the above-mentioned processes on the side of the pathogen and/or the host by applying functional and biochemical analyses based on knock-out mutants and knock-down experiments. At the theoretical (i.e. mathematical and computational) side, systems biology of microbial infection comprises:

1. modelling of molecular mechanisms of bacterial or fungal infections
2. modelling of non-protective and protective immune defences against microbial pathogens to generate information for possible immune therapy approaches
3. modelling of infection dynamics and identification of biomarkers for diagnosis and for individualized therapy
4. identifying essential virulence determinants and thereby predicting potential drug targets
