The International Conference on Machine Learning and Data Mining MLDM is the third meeting in a series of biennial events which started in 1999 organized by the Institute of Computer Vision and Applied Computer Sciences IBAI in Leipzig MLDM began as a workshop and is now a conference and has brought the topic of machine learning and data mining to the attention of the research community Seventy ve papers were submitted to the conference this year The program committee worked hard to select the most progressive research in a fair and competent review process which led to the acceptance of 33 papers for presentation at the conference The 33 papers in these proceedings cover a wide variety of topics related to machine learning and data mining The two invited talks deal with learning in case based reasoning and with mining for structural data The contributed papers can be grouped into nine areas support vector machines pattern decision trees clustering classification and retrieval case based reasoning Bayesian models and methods association rules and applications We would like to express our appreciation to the reviewers for their precise and highly professional work We are grateful to the German Science Foundation for its support of the Eastern European researchers We appreciate the help and understanding of the editorial staff at Springer Verlag and in particular Alfred Hofmann who supported the publication of these proceedings in the LNAI series Last but not least we wish to thank all the speakers and participants who contributed to the success of the conference

**Data Analysis and Pattern Recognition in Multiple Databases** Animesh Adhikari, Jhimli Adhikari, Witold Pedrycz, 2013-12-09 Pattern recognition in data is a well known classical

problem that falls under the ambit of data analysis. As we need to handle different data, the nature of patterns, their recognition, and the types of data analyses are bound to change. Since the number of data collection channels increases in the recent time and becomes more diversified, many real world data mining tasks can easily acquire multiple databases from various sources. In these cases, data mining becomes more challenging for several essential reasons. We may encounter sensitive data originating from different sources; those cannot be amalgamated. Even if we are allowed to place different data together, we are certainly not able to analyze them when local identities of patterns are required to be retained. Thus, pattern recognition in multiple databases gives rise to a suite of new challenging problems different from those encountered before. Association rule mining, global pattern discovery, and mining patterns of select items provide different patterns discovery techniques in multiple data sources. Some interesting item-based data analyses are also covered in this book. Interesting patterns such as exceptional patterns, icebergs, and periodic patterns have been recently reported. The book presents a thorough influence analysis between items in time-stamped databases. The recent research on mining multiple related databases is covered while some previous contributions to the area are highlighted and contrasted with the most recent developments.

**Machine Learning and Data Mining in Pattern Recognition** Petra Perner, 2019 *Machine Learning and Data Mining in Pattern Recognition* Petra Perner, Maria Petrou, 1999-09-08. The field of machine learning and data mining in connection with pattern recognition enjoys growing popularity and attracts many researchers. Automatic pattern recognition systems have proven successful in many applications. The wide use of these systems depends on their ability to adapt to changing environmental conditions and to deal with new objects. This requires learning capabilities on the parts of these systems. The exceptional attraction of learning in pattern recognition lies in the specific data themselves and the different stages at which they get processed in a pattern recognition system. This results in a specific branch within the field of machine learning. At the workshop, machine learning approaches for image pre-processing, image segmentation, recognition, and interpretation were shown. Machine learning systems were shown on applications such as document analysis and medical image analysis. Many databases are developed that contain multimedia sources such as images, measurement protocols, and text documents. Such systems should be able to retrieve these sources by content. That requires specific retrieval and indexing strategies for images and signals. Higher quality database contents can be achieved if it were possible to mine these databases for their underlying information. Such mining techniques have to consider the specific characteristics of the image sources. The field of mining multimedia databases is just starting out. We hope that our workshop can attract many other researchers to this subject.
