Methyl Bromide Risk Characterization In California:

Methyl Bromide Risk Characterization in California National Research Council, Commission on Life Sciences, Board on Environmental Studies and Toxicology, Committee on Toxicology, Subcommittee for the Review of the Risk Assessment of Methyl Bromide, 2000-06-13 Methyl bromide is gaseous pesticide used to fumigate soil crops commodity warehouses and commodity shipping facilities Up to 17 million pounds of methyl bromide are used annually in California to treat grapes, almonds, strawberries and other crops. Methyl bromide is also a known stratospheric ozone depleter and as such is scheduled to be phased out of use in the United States by 2005 under the United Nations Montreal Protocol. In California the use of methyl bromide is regulated by the Department of Pesticide Regulation (DPR) which is responsible for establishing the permit conditions that govern the application of methyl bromide for pest control. The actual permits for use are issued on a site specific basis by the local county agricultural commissioners. Because of concern for potential adverse health effects in 1999, DPR developed a draft risk characterization document for inhalation exposure to methyl bromide. The DPR document is intended to support new regulations regarding the agricultural use of this pesticide. The proposed regulations encompass changes to protect children in nearby schools, establish minimum buffer zones around application sites, require notification of nearby residents and set new limits on hours that fumigation employees may work. The State of California requires that DPR arrange for an external peer review of the scientific basis for all regulations. To this end the National Research Council (NRC) was asked to review independently the draft risk characterization document prepared by DPR for inhalation exposure to methyl bromide. The task given to NRC's subcommittee on methyl bromide states the following: The subcommittee will perform an independent scientific review of the California Environmental Protection Agency's risk assessment document on methyl bromide. The subcommittee will 1) determine whether all relevant data were considered, 2) determine the appropriateness of the critical studies, 3) consider the mode of action of methyl bromide and its implications in risk assessment, and 4) determine the appropriateness of the exposure assessment and mathematical models used. The subcommittee will also identify data gaps and make recommendations for further research relevant to setting exposure limits for methyl bromide. This report evaluates the toxicological and exposure data on methyl bromide that characterize risks at current exposure levels for field workers and nearby residents. The remainder of this report contains the subcommittee's analysis of DPR's risk characterization for methyl bromide. In Chapter 2 the critical toxicological studies and endpoints identified in the DPR document are evaluated. Chapter 3 summarizes DPR's exposure assessment and the data quality and modeling techniques employed in its assessment are critiqued. Chapter 4 provides a review of DPR's risk assessment including the adequacy of the toxicological database DPR used for hazard identification, an analysis of the margin of exposure data and appropriateness of uncertainty factors used by DPR. Chapter 5 contains the subcommittee's conclusions about DPR's risk characterization, highlights data gaps and makes recommendations for future research. *Hayes' Handbook of Pesticide*

Secondhand Pesticides Susan E. Kegley, Anne Katten, Marion Moses, 2003 **Pesticides, Organic Contaminants, and Pathogens in Air** James N. Seiber, Thomas M. Cahill, 2021-10-07 The air is an important but largely unrecognized source of contaminant fate in the environment including transport of pesticides and contaminants to nontarget areas and exposures for people and wildlife. This book summarizes and places in perspective the potential transport, transformation and health implications of pesticides and contaminants in air including the air we breathe. It delves into the hypothesis that the atmosphere is the most significant environmental compartment affecting the overall transport and fate of many classes of environmental contaminants. The authors draw parallels between sampling, analysis and impact of airborne toxics and particulate matter with the COVID-19 pandemic. Airborne viruses and fine particulate matter which are of similar size have remarkable parallels in how they are transmitted and accumulated in the respiratory tract. FEATURES: Assesses exposures of people and wildlife to airborne chemicals. Includes case study applications with relevant data summarized for pesticides and contaminants in air. Discusses approaches to modeling pesticides and contaminants dispersion and fate in air. Includes an assessment of the physicochemical properties of pesticides and contaminants that influence sampling and atmospheric mobility and fate. The authors are global experts in air contaminant research and this book is well organized and helpful for people interested in regulatory health and other topics related to pesticides and contaminants in air.
