Current Trends in the Study of Bacterial and Viral Fish and Shrimp Diseases Ka Yin Leung, 2004 The important volume summarizes the current trends and developments in the study of bacterial and viral fish diseases Books on these subjects are few and relevant review articles are mostly outdated This volume will thus serve as a platform for scientists and aquaculturists to understand the current limitations as well as new developments so that fish health and disease control can advance to new heights The first section provides readers with an overview of the bacterial and viral diseases and the current understanding of innate immunity and interactions with pathogens Section II includes case studies where three pathogens are presented namely two bacteria *Aeromonas hydrophila* and *Vibrio anguillarum* the common causes of bacterial diseases in freshwater and marine aquaculture respectively and the white spot syndrome virus an important viral disease in shrimp These case studies serve as models for the study of various bacterial and viral diseases Section III presents new platform technologies that are widely used in the study of human pathogens It aims to spur fish biologists to use modern and cutting edge technologies for their studies so that the study of fish disease can move into the mainstream and focus on the basics The final section is on marine biotechnology discussing biotechnology products that are urgently needed for the aquaculture industry spin offs from basic research including diagnostics immunotherapy and vaccine development and the use of probiotics *Pandemic Influenza Vaccine Approaches: Current Status and Future Directions* Rebecca Jane Cox, Michael Schotsaert, Corey Patrick Mallett, 2022-09-28

Weiner, 1997-12-11 Genetic DNA immunization represents a novel approach to vaccine and immune therapeutic development The direct injection of nucleic acid expression cassettes into a living host results in a limited number of its cells becoming factories for production of the introduced gene products This host inappropriate gene expression has important immunological consequences resulting in the specific immune activation of the host against the gene delivered antigen The recent demonstration by a number of laboratories that the induced immune responses are functional in experimental models against both specific infectious diseases and cancers is likely to have dramatic consequences for the development of a new generation of experimental

vaccines and immune therapies This technology has the potential to enable the production of vaccines and immune based therapies that are not only effective immunologically but are accessible to the entire world rather than just to the most developed nations Vaccine Development Vaccination against pathogenic microorganisms represents one of the most important advances in the history of medicine Vaccines including those against polio measles mumps rubella hepatitis A hepatitis B pertussis and other diseases have dramatically improved and protected more human lives than any other avenue of modern medicine The vaccine against smallpox for example has been so successful that it is now widely believed that this malicious killer responsible for more deaths in the twentieth century than World Wars I and II combined has been removed from the face of the earth
