SIMULATION OF ORTHOGONAL METAL CUTTING BY FINITE ELEMENT ANALYSIS. , The aim of this thesis is to compare various simulation models of orthogonal cutting process with each other as well as with various experiments The effects of several process parameters such as friction and separation criterion on the results are analyzed As simulation tool commercial implicit finite element codes MSC Marc Deform2D and the explicit code Thirdwave AdvantEdge are used Separation of chip from the workpiece is achieved either only with continuous remeshing or by erasing elements according to the damage accumulated From the results cutting and thrust forces shear angle chip thickness and contact length between the chip and the rake face of the tool can be estimated For verification of results several cutting experiments are performed at different cutting conditions such as rake angle and feed rate Results show that commercial codes are able to simulate orthogonal cutting operations within reasonable limits Friction is found to be the most critical parameter in the simulation since good agreement can be achieved for individual process variables by tuning it Therefore simulation results must be assessed with all process variables and friction parameter should be tuned according to the shear angle results Plain damage model seems not appropriate for separation purposes of machining simulations On the other hand although remeshing gives good results it leads to the misconception of crack generation at the tip of the tool Therefore a new separation criterion is necessary to achieve both good physical modeling and prediction of process variables FE-simulation of Metal Cutting Processes Ahmet Semih Ertürk,2021 **Metal Cutting Simulation of 4340 Steel Using an Accurate Mechanical Description of Material Strength and Fracture** ,1996 Strength and fracture constitutive relationships containing strain rate dependence and thermal softening are important for accurate simulation of metal cutting The mechanical behavior of a hardened 4340 steel was characterized using the von Mises yield function the Mechanical Threshold Stress model and the Johnson Cook fracture model This constitutive description was implemented into the explicit Lagrangian FEM continuum mechanics code EPIC and orthogonal plane strain metal cutting calculations were performed Heat conduction and friction at the toolwork piece interface were included in the simulations These transient calculations were advanced in time until steady state machining behavior force was realized Experimental cutting force data cutting and thrust forces were measured for a planning operation and compared to the calculations 13 refs 6 figs *Simulation of Metal Cutting Processes Using Meshfree Methods* Niklaus Rüttimann,2012 **Finite Element Simulation of Orthogonal Metal Cutting Using an ALE Approach** Abdulfatah Maftah,2008 **Simulation on Intermittent Metal Cutting** Per Wallén,1989 **Finite Element Simulation of Metal Cutting for Predicting Residual Stresses from Turning** Marcello Salio,2003 **Finite Element Simulation of Metal Cutting Using LS Dyna** Vishnu Vardhan Chandrasekaran,2011 **Computer Simulation of**

The scientific goal of the present work was to model the workpiece material behavior of steels in the metal cutting process depending on the occurring thermo mechanical loads. The results of this work shall make a significant contribution to the predictive process design of the cutting process by means of Finite Element FE simulations for the virtual representation of the reality in the sense of the digital twin. To achieve the objective, extensive empirical examinations were conducted in a first step which included conventional material scientific and orthogonal cutting tests. This enabled the establishment of a database of the workpiece response with increasing thermo mechanical loads. During the orthogonal cutting examinations, integral and locally resolved process results were measured which were used as calibration and validation variables in the modeling of the workpiece material behavior. By extending an established friction test bench with a workpiece pre heating system, the friction conditions between tool and workpiece could be investigated under conditions equivalent to the cutting process. Based on the experimental results, a friction model was derived in which the observed effects of thermal softening and the localized adhesion induced increase in the apparent friction coefficient were superposed. A phenomenological material model was developed to describe the workpiece material behavior in the cutting process. The formulation of the material model was developed based on empirical examinations as well as results from the state of the art. The material model was implemented in an FE chip formation simulation using a subroutine. A hybrid optimization algorithm was developed to inversely determine the material model parameters. By means of the optimization algorithm, the material model parameters could be systematically determined inversely taking the experimentally determined process observables into account. An automated procedure linked to a user interface lowered the entry hurdle for industrial companies and inexperienced users of FE simulations and reduced the computational effort for the inverse parameter determination to about 10 days of computational execution time. The quality of the developed models and the determined model parameters were further verified by a final deduction step using the industrial example of face turning.

Machining is one of the most important manufacturing processes. Parts manufactured by other processes often require further operations before the product is ready for application. Machining Fundamentals and Recent Advances is divided into two parts. Part I explains the fundamentals of machining with special emphasis on three important aspects: mechanics of machining tools and work piece integrity. Part II is dedicated to

recent advances in machining including machining of hard materials machining of metal matrix composites drilling polymeric matrix composites ecological machining minimal quantity of lubrication high speed machining sculptured surfaces grinding technology and new grinding wheels micro and nano machining non traditional machining processes and intelligent machining computational methods and optimization Advanced students researchers and professionals interested or involved in modern manufacturing engineering will find the book a useful reference

Simulation of Random Tool Lives in Metal Cutting on a Flexible Machine Martin Noël, Bernard Lamond, Manbir S. Sodhi, Université Laval. Faculté des sciences de l'administration. Direction de la recherche, 2006 This paper describes some numerical experiments related to a tool management model for a flexible machine equipped with a tool magazine variable cutting speed and sensors to monitor tool wear when tool life due to flank wear is stochastic A computer simulation was performed where decision about tool loading and cutting speed were based on a deterministic mathematical programming model in which tool setup times are added up to total processing time whenever a tool is required but absent from the tool magazine Two types of sensor systems are presented offline sensors and online sensors It is assumed that the sensor only gives information about whether or not the tool is in good condition to continue processing The simulation aims at answering six questions 1 Which statistical distributions should be used to simulate the life of a cutting tool 2 How effective is a deterministic model if tool lives are stochastic 3 How effective are the two sensor systems 4 If the machine must be stopped to inspect tool conditions what are the best parameters to use i e inter inspection times and threshold 5 Is the use of a stochastic model still justified when tool life variability decreases i e tool quality and reliability increases 6 Does adjusting cutting speed while processing a given part type help improve productivity
