Orbital Mechanics For Engineering Students Third Edition Aerospace Engineering:

Orbital Mechanics for Engineering Students Howard D. Curtis, 2009-10-26 Orbital Mechanics for Engineering Students Second Edition provides an introduction to the basic concepts of space mechanics. These include vector kinematics in three dimensions, Newton's laws of motion and gravitation, relative motion, the vector-based solution of the classical two-body problem, derivation of Kepler's equations, orbits in three dimensions, preliminary orbit determination, and orbital maneuvers. The book also covers relative motion and the two-impulse rendezvous problem, interplanetary mission design using patched conics, rigid body dynamics used to characterize the attitude of a space vehicle, satellite attitude dynamics, and the characteristics and design of multi-stage launch vehicles. Each chapter begins with an outline of key concepts and concludes with problems that are based on the material covered. This text is written for undergraduates who are studying orbital mechanics for the first time and have completed courses in physics, dynamics, and mathematics, including differential equations and applied linear algebra. Graduate students, researchers, and experienced practitioners will also find useful review materials in the book. **NEW** Reorganized and improved discussions of coordinate systems, new discussion on perturbations and quaternions. **NEW** Increased coverage of attitude dynamics, including new Matlab algorithms and examples in chapter 10. New examples and homework problems. Orbital Mechanics for Engineering Students Howard D. Curtis, 2020-08-31 Orbital Mechanics for Engineering Students Fourth Edition is a key text for students of aerospace engineering. While this latest edition has been updated with new content and included sample problems, it also retains its teach-by-example approach that emphasizes analytical procedures, computer-implemented algorithms, and the most comprehensive support package available, including fully worked solutions, PPT lecture slides, and animations of selected topics. Highly illustrated and fully supported with downloadable MATLAB algorithms for project and practical work, this book provides all the tools needed to fully understand the subject. Provides a new chapter on the circular restricted 3-body problem, including low-energy trajectories. Presents the latest on interplanetary mission design, including non-Hohmann transfers and lunar missions. Includes new and revised examples and sample problems. Practical Astrodynamics Alessandro de Iaco Veris, 2017-11-28 This modern textbook guides the reader through the theory and practice of the motion and attitude control of space vehicles. It first presents the fundamental principles of spaceflight mechanics and then addresses more complex concepts and applications of perturbation theory, orbit determination and refinement, space propulsion, orbital maneuvers, interplanetary trajectories, gyroscope dynamics, attitude control, and rocket performance. Many algorithms used in the modern practice of trajectory computation are also provided. The numerical treatment of the equations of motion, the related methods, and the tables needed to use them receive particular emphasis. A large collection of bibliographical references, including books, articles, and items from the gray literature, is provided at the end of each chapter, and attention is drawn to many internet resources available to the reader. The book will be of particular value to undergraduate and graduate students in
