Maze, Neal Hawkins, Christian Sax, 2008 In urban communities there are often limited amounts of right of way available for
establishing a large setback distance from the curb for fixed objects Urban communities must constantly weigh the cost of
purchasing additional right of way for clear zones against the risk of fixed object crashes From 2004 to 2006 this type of
crash on curbed roads represented 15% of all fatal crashes and 3% of all crashes in the state of Iowa Many states have kept
the current minimum AASHTO recommendations as their minimum clear zone standards however other states have decided
that these recommendations are insufficient and have increased the required minimum clear zone distance to better suit the
judgment of local designers This report presents research on the effects of the clear zone on urban curbed streets The
research was conducted in two phases The first phase involved a synthesis of practice that included a literature review and a
survey of practices in jurisdictions that have developmental and historical patterns similar to those of Iowa The second phase
involved investigating the benefits of a 10 ft clear zone which included examining urban corridors in Iowa that meet or do not
meet the 10 ft clear zone goal The results of this study indicate that a consistent fixed object offset results in a reduction in
the number of fixed object crashes a 5 ft clear zone is most effective when the goal is to minimize the number of fixed object
crashes and a 3 ft clear zone is most effective when the goal is to minimize the cost of fixed object crashes **Public Roads**
