Nucleic Acids In Innate Immunity:

Nucleic Acids in Innate Immunity Ken J. Ishii, Shizuo Akira, 2008-05-22 Until recently innate immunity was regarded as a relatively nonspecific system designed to engulf and destroy pathogens. However, new studies show that the innate immune system is highly developed in its ability to discriminate between self and foreign entities. Understanding this mechanism can lead to therapeutic strategies based on manipulation.

Dr. Prakash Sambhara, 2012-11-26 The discovery of Toll-like receptors (TLRs) in the late 1990s ushered in a new age of discovery for innate immunity. The importance of TLRs for immunology and biomedical research was recognized with the Nobel Prize for Medicine or Physiology in 2011. The prize was shared by three scientists: Ralph Steinman for the discovery of dendritic cells.

The Innate Immune System Masaru Taniguchi, S. Akira, Toshinori Nakayama, 2005 The Innate Immune System: Strategies for Disease Control is the result of proceedings of the Uehara Memorial Foundation Symposium held in Tokyo, Japan. The latest research on molecular events in innate immunity and the interface

between innate and acquired immunity was discussed at the symposium The book contains 30 papers contributed by prominent investigators in the field of innate immunology and is divided into 3 themes Receptor signalling and function in innate immune responses Interface between innate and acquired immunity and Manipulation of the innate immune system and new strategies for disease control It was the explicit aim of the symposium to increase understanding in these fields and further aid the development of novel strategies for disease control in the 21st Century The Innate Immune System Strategies for Disease Control will be of particular interest to immunologists medical students biomedical researchers and microbiologists alike Infection, Inflammation, Cardiovascular diseases and Neurodegeneration Deng-Feng

Nucleic Acid-Associated Inflammation Nadine Laguette,Christelle Langevin,David Olagnier,Vincenzo Torracca,Claire Isabelle Vanpouille-Box,Eloi R. Verrier,2021-12-30 *The Journal of Immunology* ,2008 Receptor usage and pathogenesis in acute and chronic viral infection Yasuko Tsunetsugu-Yokota,Kazutaka Terahara, In the first phase of the viral life cycle the virus enters cells using a specific cell surface receptor Many viruses use multiple receptors some of which are unique to a certain cell type while others are ubiquitous in many cell types Depending on the receptors used the viral cell tropism is determined which may result in the characteristic distribution of virus infected cells tissues Obviously virus entry is not the whole story After the virus enters various cellular proteins interact with it some support virus replication while others inhibit it The intrinsic anti viral cellular machinery differs among cell types thus viral cell tropism based on the receptor usage plays an important role in the pathogenesis For example HIV 1 utilizes one of two co receptors CXCR4 or CCR5 in addition to a major receptor CD4 CCR5 expression is restricted to a certain subset of memory CD4 T cells while CXCR4 expression is rather ubiquitous among CD4 T cells Therefore the latent infection of CCR5 utilizing HIV 1 in resting memory CCR5 T cells would be largely responsible for intermittent virus blimps accompanied by immune activation during chronic HIV infection This may explain why CCR5 utilizing HIV 1 is preferentially isolated in the early phase of HIV 1 infection even when the HIV 1 transmitter carries CXCR4 utilizing HIV 1 in abundance In the case of the measles virus

CD150 Signaling Lymphocyte Activation Molecule SLAM is a major receptor while vaccine strains utilize CD46 when CD150 is not available The third possible entry receptor would also be utilized for the infection of lung epithelial cells The impact of these receptor usages in vivo on the disease outcome is now under investigation We also know that the distinct use of host cell sugar moieties mediates species tropism in the influenza virus and that a mutant virus breaking the species barrier is highly pathogenic in humans Thanks to the recent development of reverse genetics it is now possible to visualize virus infected cells or even the virus itself by using highly sensitive flow cytometry or microscopy How viral cell tropism determined by the receptor used can affect the disease course of acute and chronic virus infection is an important question to address In this Research Topic we focus on studies connecting virus receptor usage and the pathogenesis of various viruses causing acute or chronic infection
