Wijshoff,2012-12-06 The organization of data is clearly of great importance in the design of high performance algorithms and architectures Although there are several landmark papers on this subject no comprehensive treatment has appeared This monograph is intended to fill that gap We introduce a model of computation for parallel computer architectures by which we are able to express the intrinsic complexity of data organization for specific architectures We apply this model of computation to several existing parallel computer architectures e g the CDC 205 and CRAY vector computers and the MPP binary array processor The study of data organization in parallel computations was introduced as early as 1970 During the development of the ILLIAC IV system there was a need for a theory of possible data arrangements in interleaved memory systems The resulting theory dealt primarily with storage schemes also called skewing schemes for 2 dimensional matrices i e mappings from a dimensional array to a number of memory banks By means of the model of computation we are able to apply the theory of skewing schemes to various kinds of parallel computer architectures This results in a number of consequences for both the design of parallel computer architectures and for applications of parallel processing *Computer Organization, Design, and Architecture, Fifth Edition* Sajjan G.
