

Experiment 8 INTEGRATOR USING OP-AMP

AIM: To design and set up an integrator circuit using op-amp.

APPARATUS REQUIRED: Power supply, CRO, function generator, bread board, Op-amp, capacitor, and resistors.

INTEGRATOR

An inverting amplifier whose output voltage is proportional to the negative integral of the input voltage thereby simulating mathematical integration.

$$V_{out} = -\frac{1}{R_{in}C} \int_0^t V_{in} \cdot dt = -\int_0^t V_{in} \frac{dt}{R_{in} \cdot C}$$

If the Operational Amplifier Integrator is provided with a sine wave input whose frequency is varying, the integrator behaves like a "Low-Pass Filter", which produces only low frequency signal at the output. All the high frequency signal components are blocked or attenuated.

At 0 Hz, the feedback capacitor behaves like an open-circuit, so there is no feedback from the output to the inverting input of the op-amp. Now, the circuit behaves like an open-loop inverting amplifier with very high gain.

Circuit Diagram

Let $R_1 = 10K$ ohms, $R_2 = 100K$ ohms, $R_3 = 10K$ ohms, and $C_f = 0.001 \mu f$

Procedure

1. Set up the integrator circuit as shown in the figure, give square wave of 1v peak to peak, and 1 kHz frequency at the input and observe the input and output simultaneously on the CRO.
2. Repeat the experiment by using a sinusoidal wave and triangular input and observe the output.

Most designs are known combinations of common configurations tailored for the particular problem at hand In this thesis I show that much of the behavior of a designer engaged in such ordinary design can be modeled by a clearly defined computational mechanism executing a set of stylized rules Each of my rules embodies a particular piece of the designer's knowledge A circuit is represented as a hierarchy of abstract objects each of which is composed of other objects The leaves of this tree represent the physical devices from which physical circuits are fabricated By analogy with context free languages a class of circuits is generated by a phrase structure grammar of which each rule describes how one type of abstract object can be expanded into a combination of more concrete parts Circuits are designed by first postulating an abstract object which meets the particular design requirements This object is then expanded into a concrete circuit by successive refinement using rules of my grammar There are in general many rules which can be used to expand a given abstract component Analysis must be done at each level of the expansion to constrain the search to a reasonable set
