Immune System Boost Reviews New:

The Neonatal Immune System: A Unique Host-Microbial Interface Joseph M. Bliss, James L. Wynn, 2018-01-25 Emerging from the protective environment of the uterus the newborn is exposed to a myriad of microbes and quickly establishes a complex microbiome that shapes the infant's biology in ways that are only now beginning to come to light. Among these exposures are a number of potential pathogens. The host responses to these pathogens in the neonatal period are unique, reflecting a developing immune system even with delivery at term. Preterm infants are delivered at a time when host defense mechanisms are even less developed and therefore face additional risk. As such, the organisms that cause disease in this period are different from the pathogens that are common in other age groups or the disease they cause manifests in more severe fashion. Developmental alterations in both innate and adaptive immune responses in neonates have been documented among many cell types and pathways over the last several decades. Contemporary insights into the human immune system and methodologies that allow an omics approach to these questions have continued to provide new information regarding the mechanisms that underlie the human neonate as an immunocompromised host. This Research Topic highlights studies related to this unique host pathogen interface. Contributions include those related to the innate or adaptive immune system of neonates, their response to microbial colonization or infection, and/or the pathogenesis of microbes causing disease in neonates.

Radiation-induced effects and the immune system Gabriele Multhoff, Alan G. Pockley, Udo S. Gaipl, Franz Rödel, Numerous developments in molecular biology have led to an explosive growth in the knowledge underlying mechanisms of carcinogenesis, cell signalling, tumor progression and development of metastasis. However, cure of cancer is still hampered by the inherent capacity of tumors to become resistant to standard therapies, to metastasize from their initial location and to proliferate in other tissue compartments. Radiotherapy is one of the main treatment modalities to achieve locoregional tumor control. However, the treatment of distant metastases further remains to be a challenge. In this special topic, we are interested to elucidate immunological aspects which are initiated and affected by radiotherapy. We also aim to describe the development of innovative immunological strategies from a preclinical stage to clinical application which could be combined with standard radiotherapeutic approaches. A special interest will also deal with the effects of radiotherapy on tumor-initiating cells as well as on the tumor microenvironment. Last but not least, the effects of different irradiation sources and qualities such as photons, protons and heavy ions will be analyzed with respect to immunological outcome.
