Measurements and Estimations of Forest Stand Parameters Using Remote Sensing Donald A. Stellingwerf, Yousif Ali Hussin, 1997-08 Generally speaking the use of remote sensing imagery will reduce field work Remote sensing imagery gives an overall view of the forest in addition to more detailed information the extent of which depends mainly on scale and film used in case of analogue data and mainly on pixel size in case of digital data This book deals with measurements and estimations of forest stand parameters using aerial photographic aircraft and satellite scanning data radar and laser imagery It includes technical and statistical information of practical examples from both temperate and tropical forests Statistical analysis of measurement data and sampling techniques are given when required The obtained results are compared with those from other techniques showing their relative advantage or disadvantage

**Field Measurements for Forest Carbon Monitoring** Coeli M Hoover, 2008-10-20 In the summer of 2003 a workshop was held in Portsmouth NH to discuss land measurement techniques for the North American Carbon Program Over 40 scientists representing government agencies academia and nonprofit research organizations located in Canada the US and Mexico participated During the course of the workshop a number of topics were discussed with an emphasis on the following The need for an intermediate tier of carbon measurements This level of study would be more extensive than state level inventories of the US Forest Service Forest Inventory and Analysis Program but less detailed than intensive ecosystem studies sites such as those in Long Term Ecological Research network This tier would ideally provide a basis to link and scale remote sensing measurements and inventory data and supply data required to parameterize existing models see Wofsy and Harriss 2002 Denning et al 2005 The design criteria that such a network of sites should meet The network and sampling design should be standardized but flexible enough to be applied across North America The design also needs to be efficient enough to be implemented without the need for large field crews yet robust enough to provide useful information Finally the spatial scale must permit easy linkage to remotely sensed data The key variables that should be measured at each site and the frequency of measurement

**Polarimetric Synthetic Aperture Radar** Irena Hajnsek, Yves-Louis Desnos, 2021-03-24 This open access book focuses on the practical application of electromagnetic polarimetry principles in Earth remote sensing with an educational purpose In the last decade the operations from fully polarimetric synthetic aperture radar such as the Japanese ALOS PALSAR the Canadian Radarsat 2 and the German TerraSAR X and their easy data access for scientific use have developed further the research and data applications at L C and X band As a consequence the wider distribution of polarimetric data sets across the remote sensing community boosted activity and development in polarimetric SAR applications also in view of future missions Numerous experiments with real data from spaceborne platforms are shown with the aim of giving an up to date and complete treatment of the unique benefits of fully polarimetric synthetic aperture radar data in five different domains forest agriculture cryosphere urban and oceans
