Turbulence and Self-Organization Mikhail Ya Marov,Aleksander V. Kolesnichenko,2013-01-16 The book deals with the development of continual models of turbulent natural media Such models serve as a ground for the statement and numerical evaluation of the key problems of the structure and evolution of the numerous astrophysical and geophysical objects The processes of ordering self organization in an originally chaotic turbulent medium are addressed and treated in detail with the use of irreversible thermodynamics and stochastic dynamics approaches which underlie the respective models Different examples of ordering set up in the natural environment and outer space are brought and thoroughly discussed the main focus being given to the protoplanetary discs formation and evolution

Searching the Heavens and the Earth Agustin UDIAS,2013-04-17 Jesuits established a large number of astronomical geophysical and meteorological observatories during the 17th and 18th centuries and again during the 19th and 20th centuries throughout the world The history of these observatories has never been published in a complete form Many early European astronomical observatories were established in Jesuit colleges During the 17th and 18th centuries Jesuits were the first western scientists to enter into contact with China and India It was through them that western astronomy was first introduced in these countries They made early astronomical observations in India and China and they directed for 150 years the Imperial Observatory of Beijing In the 19th and 20th centuries a new set of observatories were established Besides astronomy these now included meteorology and geophysics Jesuits established some of the earliest observatories in Africa South America and the Far East Jesuit observatories constitute an often forgotten chapter of the history of these sciences

Light Pollution: The Global View

H.E Schwarz,2013-03-09 The effects of light pollution on flora fauna including humans and their widely varying night time activities are often subtle and need extensive field studies to be quantified in a sensible manner Some of the highlights were The presentation of the 1st world atlas of artificial night sky brightness Cinzano et al the article by the International Darksky Association on their world wide efforts to curb light pollution Alvarez del Castillo et al the laws controlling light pollution implemented in Spain Diaz et al and Chile Sanhueza et al an overview of the work on radio frequency protection of sites Cohen et al and the excellent introduction to the topic from the Chilean point of view Daud Related topics in the book are light pollution education aircraft contrails space advertising with an added document provided by the relevant UN commission and an experiment on involving the population of an entire country in measuring sky brightness by using the internet and the media The text is aimed at professionals from a wide range of disciplines related to lighting and its effects on the night time environment in the broadest sense of the word Lay persons interested in this emerging multi disciplinary field can also find much of interest in this book

Mass-Losing Pulsating Stars and their Circumstellar Matter Y. Nakada,M. Honma,M. Seki,2003-03-31 Editing the proceedings of a scientific meeting is not an easy task Sometimes people who give an excellent talk do not send the manuscript by the deadline However this time thanks to the punctuality of all the participants

we have this excellent volume for the workshop on mass losing pulsating stars and their circumstellar matter prepared in time Almost all of the oral presentations including the summary are collected in this volume We regret that we cannot put in this volume a few posters that we failed to receive before the editorial work The workshop was planned as a small meeting with less than fifty attendants because the city of Sendai was far from the most of the active institutions However the number of submitted papers exceeded the SOC's expectation many interesting contributions had to be scheduled in the poster session Still the oral sessions were so tight that many participants might have felt frustrated for the shortage of discussions The organizers of the workshop have to apologize to the attendants for the inconvenience caused from such a happy underestimate about the size of the workshop

Kolesnichenko,2013-11-13 Space exploration and advanced astronomy have dramatically expanded our knowledge of outer space and made it possible to study the indepth mechanisms underlying various natural phenomena caused by complex interaction of physical chemical and dynamical processes in the universe Huge breakthroughs in astrophysics and the planetary sciences have led to increasingly complicated models of such media as giant molecular clouds giving birth to stars protoplanetary accretion disks associated with the solar system's formation planetary atmospheres and circumplanetary space The creation of these models was promoted by the development of basic approaches in modern mechanics and physics paralleled by the great advancement in the computer sciences As a result numerous multidimensional non stationary problems involving the analysis of evolutionary processes can be investigated using wide range numerical experiments Turbulence belongs to the most widespread and at the same time the most complicated natural phenomena related to the origin and development of organized structures dies of different scale at a definite flow regime of fluids in essentially non linear hydrodynamic systems This is also one of the most complex and intriguing sections of the mechanics of fluids The direct numerical modeling of turbulent flows encounters large mathematical difficulties while the development of a general turbulence theory is hardly possible because of the complexity of interacting coherent structures Three dimensional non steady motions arise in such a system under loss of linear flow stability defined by the critical value of the Reynolds number

Numerical Modelling of Astrophysical Turbulence Wolfram Schmidt,2013-10-07 In this SpringerBrief the author considers the underlying problems and questions that are common to numerical models of turbulence in different astrophysical systems Turbulence has emerged as an important research topic in several areas of astrophysics Understanding and modeling turbulence is particularly important for the dynamics of the interstellar medium but also for the intergalactic medium as well as in stars The advancement of methods for numerical simulations of astrophysical turbulence

however is still challenging because of gravity strong compressibility magnetic fields and other effects The book begins with a review of general aspects of numerical simulations of turbulence In the main part the author presents findings from his numerical studies on astrophysical turbulence and discusses the astrophysical implications He also explains in detail the numerical schemes utilized Readers will find that this book offers a compact yet comprehensive introduction

Turbulent

Particle-Laden Gas Flows Aleksei Y. Varaksin,2007-07-05 Results are given of experimental and theoretical studies of gas solid particles turbulent two phase flows Special emphasis is placed on studies of the behavior of particles suspended in a turbulent gas flow and their feedback effect on the characteristics of flow of the carrier phase The characteristics of heterogeneous flows in channels pipes are analyzed as well as those in the vicinity of the critical points of bodies subjected to flow and in the boundary layer developing on their surface Problems of physical simulation of turbulent gas flows which carry solid particles are treated in detail This monograph will be useful for researchers involved in investigations of gas dynamics and heat and mass transfer in multiphase flows as well as for university professors post graduate students and students

The Theory

of Homogeneous Turbulence G. K. Batchelor,1953 This is a reissue of Professor Batchelor s text on the theory of turbulent motion which was first published by Cambridge Univiersity Press in 1953 It continues to be widely referred to in the professional literature of fluid mechanics but has not been available for several years This classic account includes an introduction to the study of homogeneous turbulence including its mathematic representation and kinematics Linear problems such as the randomly perturbed harmonic oscillator and turbulent flow through a wire gauze are then treated The author also presents the general dynamics of decay universal equilibrium theory and the decay of energy containing eddies There is a renewed interest in turbulent motion which finds applications in atmospheric physics fluid mechanics astrophysics and planetary science
