Brain Oscillations and Predictive Coding: What We Know and What We Should Learn Roumen Kirov, 2017-04-28

Predictive coding PC is a neurocognitive concept according to which the brain does not process the whole qualia of external information but only residual mismatches occurring between incoming information and an individual inner model of the world. At the time of issue initiation I expected an essential focus on mismatch signals in the brain especially those captured by neurophysiologic oscillations. This was because one most plausible approach to the PC concept is to identify and validate mismatch signals in the brain. Announcing the topic revealed a much deeper consideration of intelligible minds of researchers. It turned out that what was of fundamental interest was which brain mechanisms support the formation, maintenance and consolidation of the inner model determining PC. Is PC a dynamic construct continuously modulated by external environmental or internal mental information? The reader will be delighted to get acquainted with the current views and understanding of eminent scholars in the field. It will be challenging to discover the realm of sleep where both physiological energy preserving and mental qualia principles build on the inner models to shape and transform the self. And where neurophysiologic oscillations may both transmit external information and translate inner models from state to state to preserve the self continuity and compactness.

Advanced Microsystems for Automotive Applications 2015

Tim Schulze, Beate Müller, Gereon Meyer, 2015-06-30 This edited volume presents the proceedings of the AMAA 2015 conference Berlin Germany. The topical focus of the 2015 conference lies on smart systems for green and automated driving. The automobile of the future has to respond to two major trends the electrification of the drivetrain and the automation of the transportation system. These trends will not only lead to greener and safer driving but re define the concept of the car completely particularly if they interact with each other in a synergetic way as for autonomous parking and charging self driving shuttles or mobile robots. Key functionalities like environment perception are enabled by electronic components and systems sensors and actuators communication nodes cognitive systems and smart systems integration. The book will be a valuable read for research experts and professionals in the automotive industry but the book may also be beneficial for graduate students.

statistical models knowledge representation and decision support **Manipulative approaches to human brain dynamics** Keiichi Kitajo, Takashi Hanakawa, Risto Juhani Ilmoniemi, Carlo Miniussi, 2015-05-29 In this EBook we highlight how newly emerging techniques for non invasive manipulation of the human brain combined with simultaneous recordings of neural activity contribute to the understanding of brain functions and neural dynamics in humans A growing body of evidence indicates that the neural dynamics e.g. oscillations synchrony are important in mediating information processing and networking for various functions in the human brain Most of previous studies on human brain dynamics however show correlative relationships between brain functions and patterns of neural dynamics measured by imaging methods such as electroencephalography EEG magnetoencephalography MEG near infrared spectroscopy NIRS positron emission tomography PET and functional magnetic resonance imaging fMRI In contrast manipulative approaches by non invasive brain stimulation NIBS have been developed and extensively used These approaches include transcranial magnetic stimulation TMS and transcranial electric stimulation tES such as transcranial direct current stimulation tDCS alternating current stimulation tACS and random noise stimulation tRNS which can directly manipulate neural dynamics in the intact human brain Although the neural correlate approach is a strong tool we think that manipulative approaches have far greater potential to show causal roles of neural dynamics in human brain functions There have been technical challenges with using manipulative methods together with imaging methods However thanks to recent technical developments it has become possible to use combined methods such as TMS EEG coregistration We can now directly measure and manipulate neural dynamics and analyze functional consequences to show causal roles of neural dynamics in various brain functions Moreover these combined methods can probe brain excitability plasticity and cortical networking associated with information processing in the intact human brain The contributors to this EBook have succeeded in showcasing cutting edge studies and demonstrate the huge impact of their approaches on many areas in human neuroscience and clinical applications **Network** ,1998
