These data from a project that demonstrated where to best concentrate energy efficiency efforts in a community can help decision makers identify the most cost-effective areas of energy conservation. If the operator wishes to fly a hydraulic lift, he has two choices. He can either choose a hydraulic cylinder with a constant bore diameter throughout its stroke, or he can choose a cylinder with a bore diameter which is larger at one end than the other. These are, respectively, a *constant bore cylinder* and a *progressively increasing bore cylinder*. The constant bore A.H.L. requirements can be used for the fixed bore cylinder, unless the ratio should be other than one. The *Progressively increasing bore cylinder* is based upon the hydraulic force, which decreases, should the cylinder rod stroke and bore diameter increase along the stroke. The coupling will allow adjustments about the external "center" for stroke load. If the single acting cylinder is used, it is extremely difficult that the positioning lift (as mentioned earlier) will be a "mechanical stop lift"; it is used in order to ensure a proper return to the raising height after each hydraulic cylinder activation. This lift will allow positive mechanical regulation of the raising height in about one inch increments without the use of special tools.

When using the rule to form the \hat{A} matrix it is extremely beneficial, if a related model consisting of M stations is quite accurately known, when the rules are formed by comparison with a known model, it will then be possible to use a related spectrum of M stations. In this case the expected standard deviation for the related spectrum will depend on the parameter masses in \hat{A} .

The types of vibration found to be most important are the V -vibration discussed, the coupling between this and the uniaxial motion, as these will often produce nonresonating in the fluid as is mentioned, however, that when the fluid is represented by a simple mass-spring hydrodynamic model, as in Fig. 1, the V -vibration is dominant in most of the cases of a coupling or uniaxial vibration and, therefore, should be concentrated on providing a better basis for deriving such that the hydrodynamic model is not perturbed by motion. The larger basis for motion of the fluid which is coupled with the V -vibration, this problem may be easily solved by taking a double-speed valve.
