in the world Europe alone is responsible for more than 30% of emissions or about 900 million tons of CO2 per year Heating  
and air conditioning are the main cause of greenhouse gas emissions in buildings Most buildings currently in use were built  
with poor energy efficiency criteria or depending on the country and the date of construction none at all Therefore regardless  
of whether construction regulations are becoming stricter the real challenge nowadays is the energy rehabilitation of existing  
buildings It is currently a priority to reduce or ideally eliminate the waste of energy in buildings and at the same time supply  
the necessary energy through renewable sources The first can be achieved by improving the architectural design  
construction methods and materials used as well as the efficiency of the facilities and systems the second can be achieved  
through the integration of renewable energy wind solar geothermal etc in buildings In any case regardless of whether the  
energy used is renewable or not the efficiency must always be taken into account The most profitable and clean energy is
