Roschke,Hsiang-Yueh Yeh,Steven Esche,1997 This report documents a study of the feasibility of using soundwalls constructed of recycled plastics in place of conventional building materials Important considerations in selecting materials used in this study include environmental impact acoustics aesthetics performance safety and cost Various recycled materials were solicited from commercial manufacturers and subjected to a number of laboratory and field tests These tests include three point bending tests impact hammer excitations and exposure to different types of weather Based on those results several of the most promising materials were selected for construction of a full scale field installation of a test section of a soundwall This field section was monitored for a period of one year for response to environmental factors such as wind and exposure to ultraviolet radiation Analysis of the field structure includes system identification of dynamic characteristics finite element simulation and acoustic performance Results show that noise insertion loss of the soundwall is exceptional Structurally the prototype soundwall performed adequately over the course of the project with only a few members showing detrimental effects from the harsh thermal environment System identification and experimental analysis of test data were successfully implemented and indicate that the prototype soundwall is moderately wind sensitive A finite element model of the soundwall was developed to simulate both static and dynamic response to loads Using methods of modal superposition and random response deflection was predicted for the top of the wall due to application of a strong wind event **California Commissioner of Corporations Current Official Opinions** California.
