Robert Henry,Blake Simmons,Jason Lupoi,2016-06-09 The conversion of lignocellulosic biomass into renewable fuels and other commodities has provided an appealing alternative towards supplanting global dependence on fossil fuels The suitability of multitudes of plants for deconstruction to useful precursor molecules and products is currently being evaluated These studies have probed a variety of phenotypic traits including cellulose non cellulosic polysaccharide lignin and lignin monomer composition glucose and xylose production following enzymatic hydrolysis and an assessment of lignin carbohydrate and lignin lignin linkages to name a few These quintessential traits can provide an assessment of biomass recalcitrance enabling researchers to devise appropriate deconstruction strategies Plants with high polysaccharide and lower lignin contents have been shown to breakdown to monomeric sugars more readily Not all plants contain ideal proportions of the various cell wall constituents however The capabilities of biotechnology can alleviate this conundrum by tailoring the chemical composition of plants to be more favorable for conversion to sugars fuels etc Increases in the total biomass yield cellulose content or conversion efficiency through for example a reduction in lignin content are pathways being evaluated to genetically improve plants for use in manufacturing biofuels and bio based chemicals Although plants have been previously domesticated for food and fiber production the collection of phenotypic traits prerequisite for biofuel production may necessitate new genetic breeding schemes Given the plethora of potential plants available for exploration rapid analytical methods are needed to more efficiently screen through the bulk of samples to hone in on which feedstocks contain the desired chemistry for subsequent conversion to valuable renewable commodities The standard methods for analyzing biomass and related intermediates and finished products are laborious potentially toxic and or destructive They may also necessitate a complex data analysis significantly increasing the experimental time and add unwanted delays in process monitoring where delays can incur in significant costs Advances in thermochemical and spectroscopic techniques have enabled the screening of thousands of plants for different phenotypes such as cell wall cellulose non cellulosic polysaccharide and lignin composition lignin monomer composition or monomeric sugar release Some instrumental methods have been coupled with multivariate analysis

providing elegant chemometric predictive models enabling the accelerated identification of potential feedstocks In addition to the use of high throughput analytical methods for the characterization of feedstocks based on phenotypic metrics rapid instrumental techniques have been developed for the real time monitoring of diverse processes such as the efficacy of a specific pretreatment strategy or the formation of end products such as biofuels and biomaterials Real time process monitoring techniques are needed for all stages of the feedstocks to biofuels conversion process in order to maximize efficiency and lower costs by monitoring and optimizing performance These approaches allow researchers to adjust experimental conditions during rather than at the conclusion of a process thereby decreasing overhead expenses This Frontiers Research Topic explores options for the modification of biomass composition and the conversion of these feedstocks into to biofuels or biomaterials and the related innovations in methods for the analysis of the composition of plant biomass and advances in assessing up and downstream processes in real time Finally a review of the computational models available for techno economic modeling and lifecycle analysis will be presented Prentice-Hall Earth Science Charles R. Reed,Alina M. Alb,2014-01-21 Offers new strategies to optimize polymer reactions With contributions from leading macromolecular scientists and engineers this book provides a practical guide to polymerization monitoring It enables laboratory researchers to optimize polymer reactions by providing them with a better understanding of the underlying reaction kinetics and mechanisms Moreover it opens the door to improved industrial scale reactions including enhanced product quality and reduced harmful emissions Monitoring Polymerization Reactions begins with a review of the basic elements of polymer reactions and their kinetics including an overview of stimuli responsive polymers Next it explains why certain polymer and reaction characteristics need to be monitored The book then explores a variety of practical topics including Principles and applications of important polymer characterization tools such as light scattering gel permeation chromatography calorimetry rheology and spectroscopy Automatic continuous online monitoring of polymerization ACOMP reactions a flexible platform that enables characterization tools to be employed simultaneously during reactions in order to obtain a complete record of multiple reaction features Modeling of polymerization reactions and numerical approaches Applications that optimize the manufacture of industrially important polymers Throughout the book the authors provide step by step strategies for implementation In addition ample use of case studies helps readers understand the benefits of various monitoring strategies and approaches enabling them to choose the best one to match their needs As new stimuli responsive and intelligent polymers continue to be developed the ability to monitor reactions will become increasingly important With this book as their guide polymer scientists and engineers can take full advantage of the latest monitoring strategies to

Krambeck,1991-07-25 In recent years there has been a convergence of trends in chemical reaction engineering and chemistry which have set the stage for significant advances in kinetic and thermodynamic modeling of processes New analytical chemistry methods new mathematical methods and new computational tools facilitate a more fundamental approach and a deeper understanding of chemical reactions in complex mixtures with very large numbers of compounds such as petroleum fractions This fortunate state of affairs has stimulated important new work both in academia and industrial research labs The purpose of the workshop that led to this book was to bring together researchers at the forefront of this field to review the state of the art stimulate communication and cooperation between industry and academia and develop a cohesive picture of research trends and future directions The chapters of the book have been organized into four main areas Continuous mixtures where the very large numbers of discrete compounds present are regarded as making up a continuum Structure activity relationships where the nature and rates of the reactions that a particular molecule undergoes are

correlated with its chemical structure thus allowing the kinetics of very large numbers of compounds to be described by a few parameters Kinetic analysis where mathematical techniques are applied to analyze the behavior of kinetic networks and Thermodynamics emphasizing the practical and computational aspects of chemical equilibrium in complex mixtures
